

**Chalk Point Oil Spill of April 7, 2000 in Patuxent River, MD:
Modeling of the Fates and Acute Biological Effects
of the Spilled Oil on the Water Column**

Appendices

Silver Spring, MD

ASA 00-148

April 2002

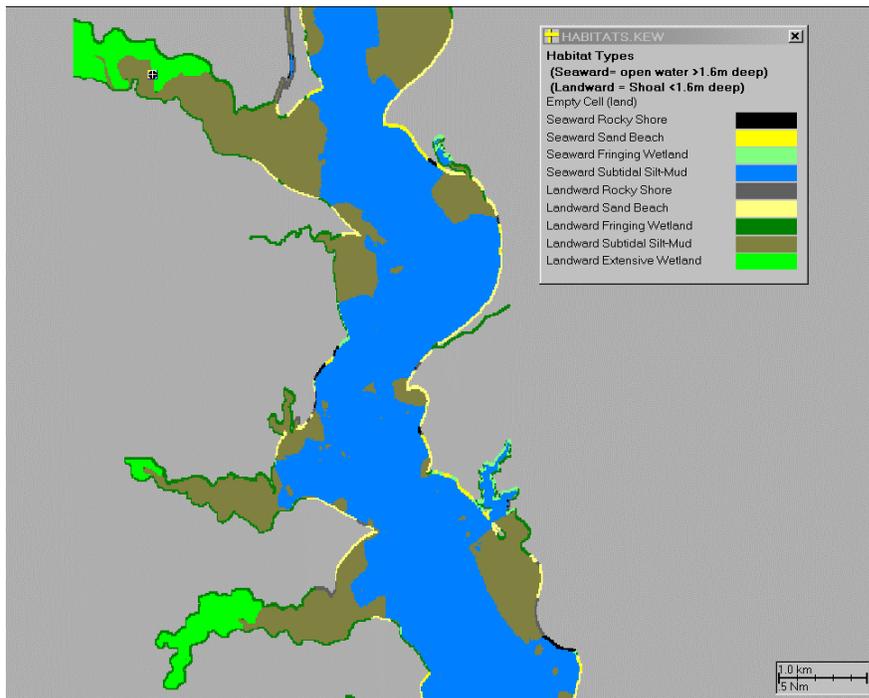

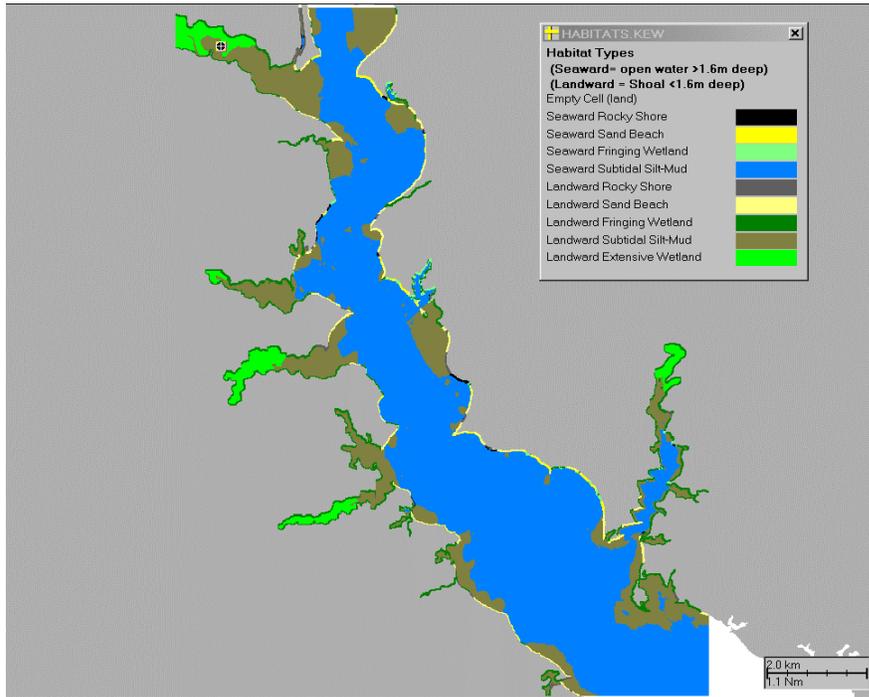

Appendix A: Geographical Data

A-1. Map of the Vicinity of the Spill

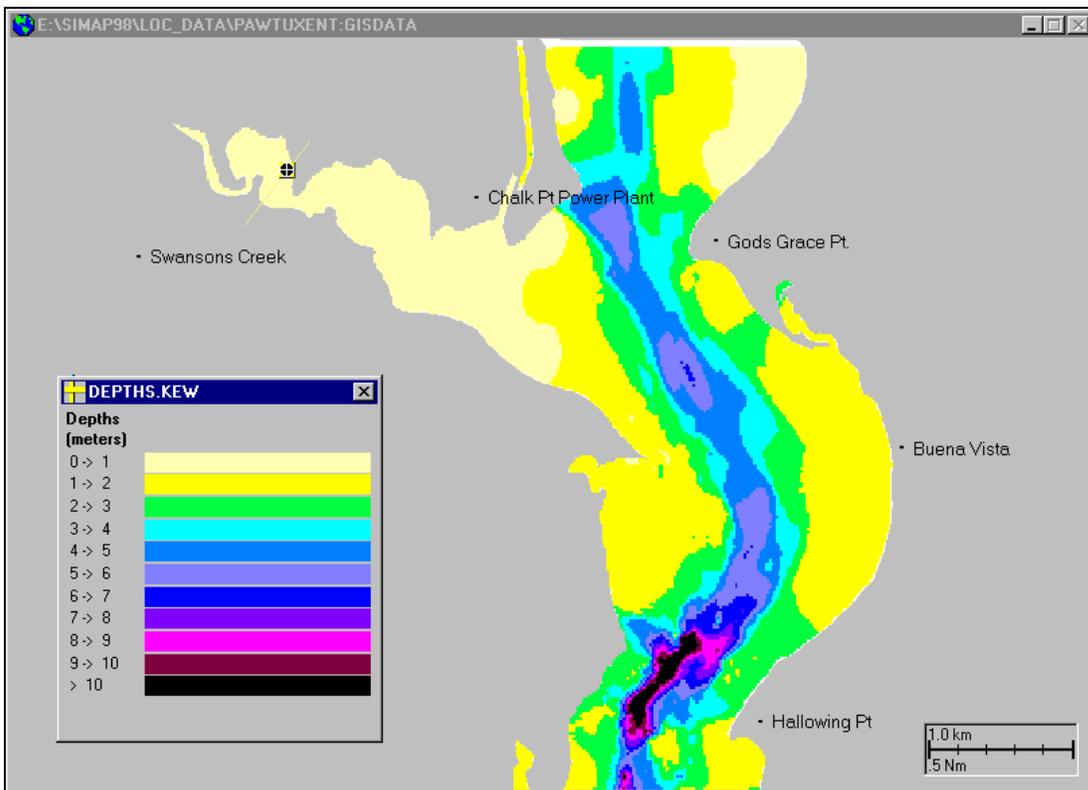

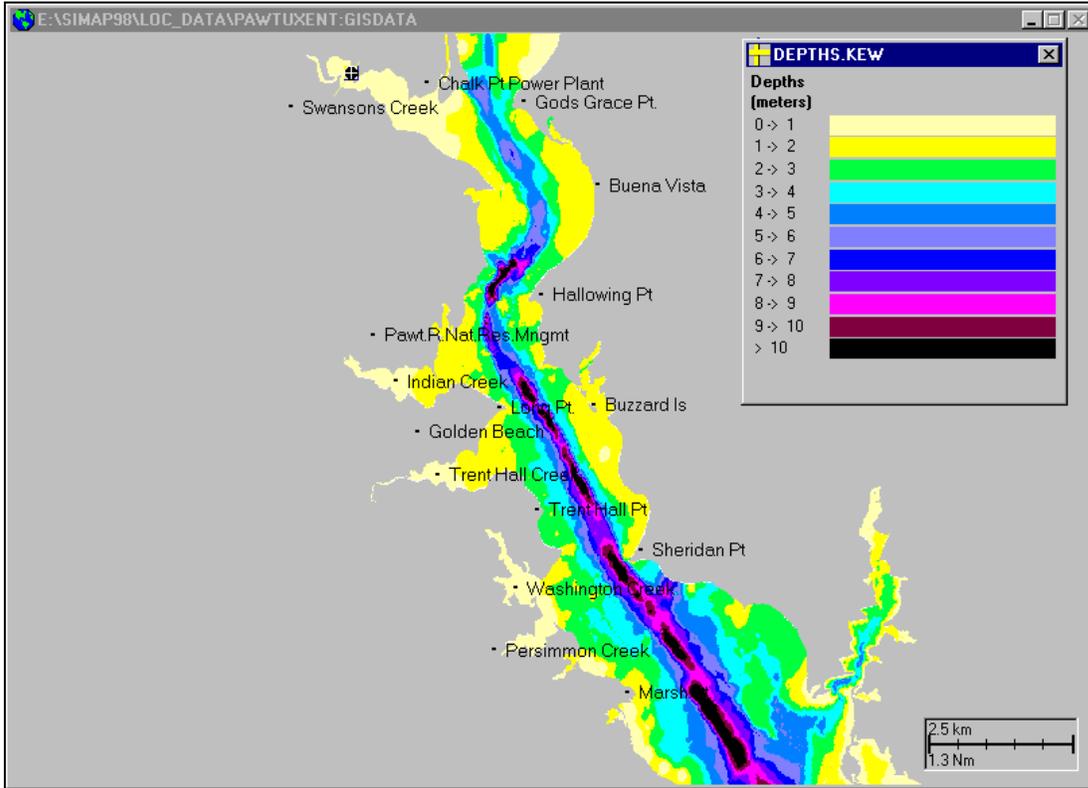

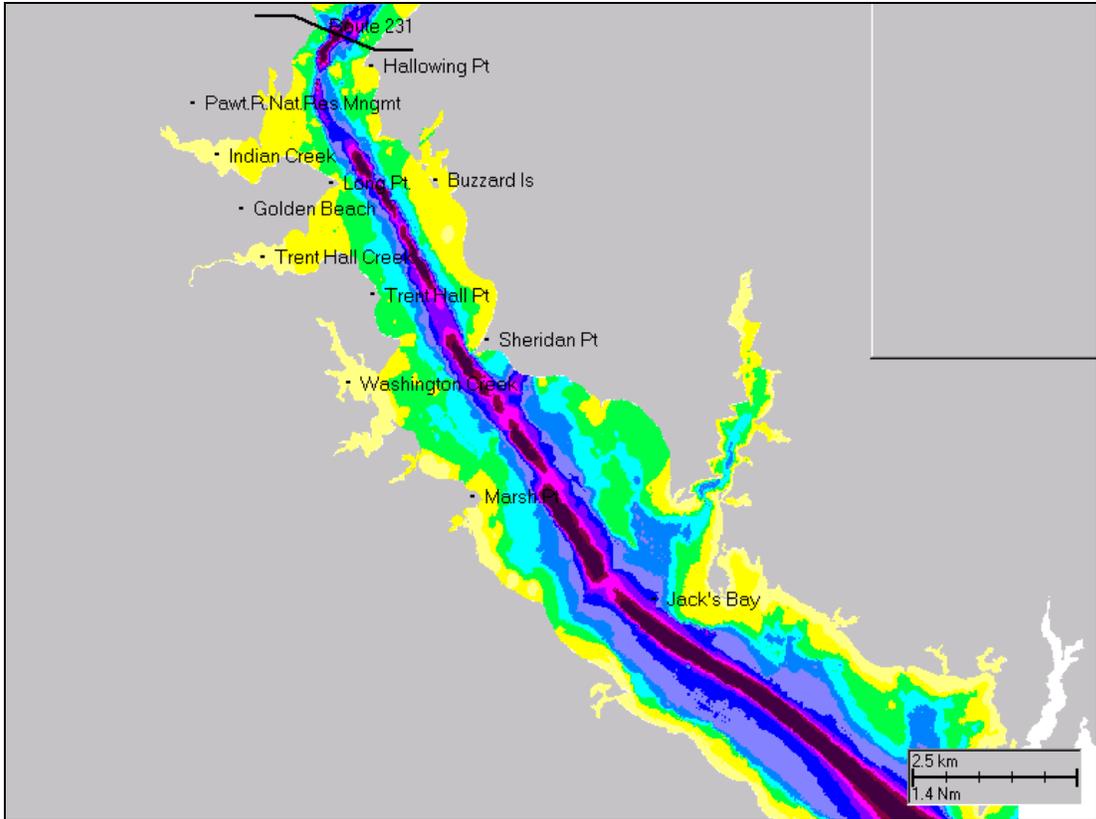

A-2. Gridded Habitat Mapping

The figures show the mapping of shoreline and habitats used in the model simulations. Note that the shoreline shown in Appendix A and in model outputs are for visual reference only, whereas the habitat (and corresponding depth) grid defines the actual shoreline to the model.

A-3. Gridded Depth Data

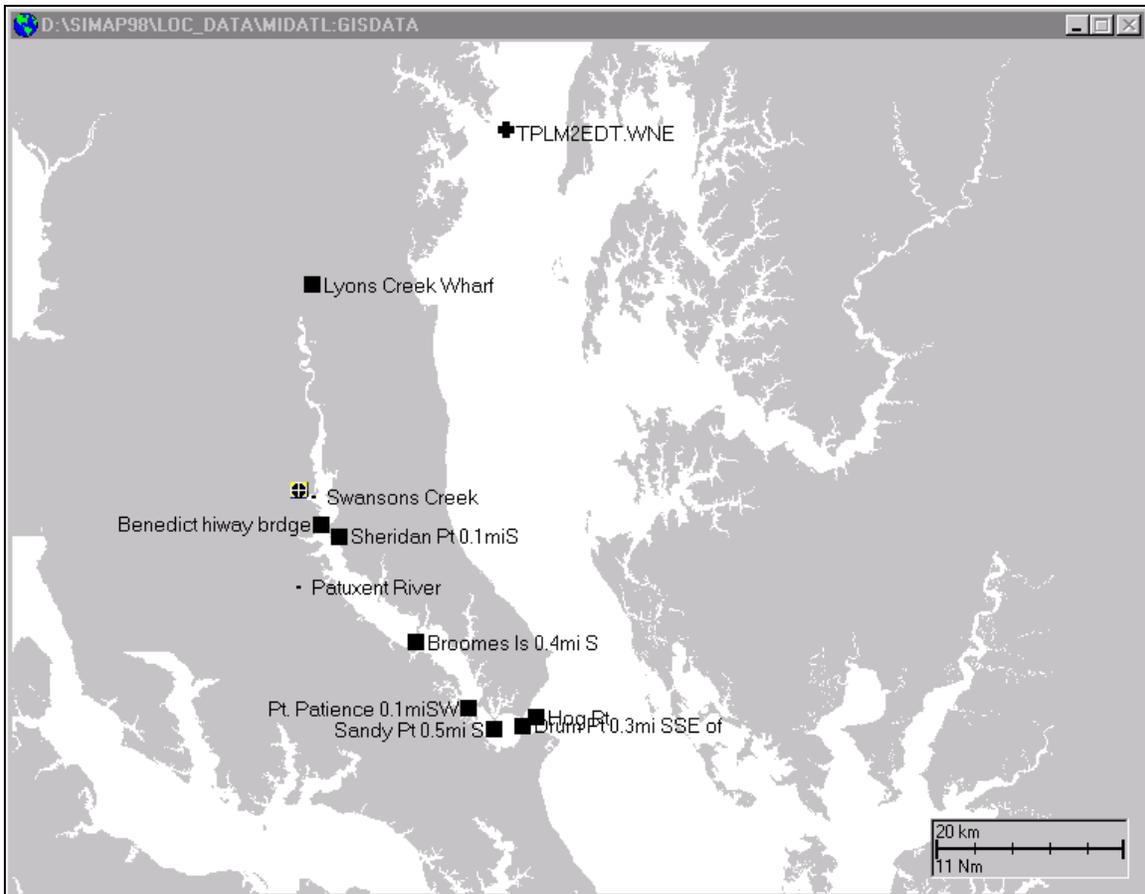

Appendix B: Current Data for the Area and Time of the Spill Event

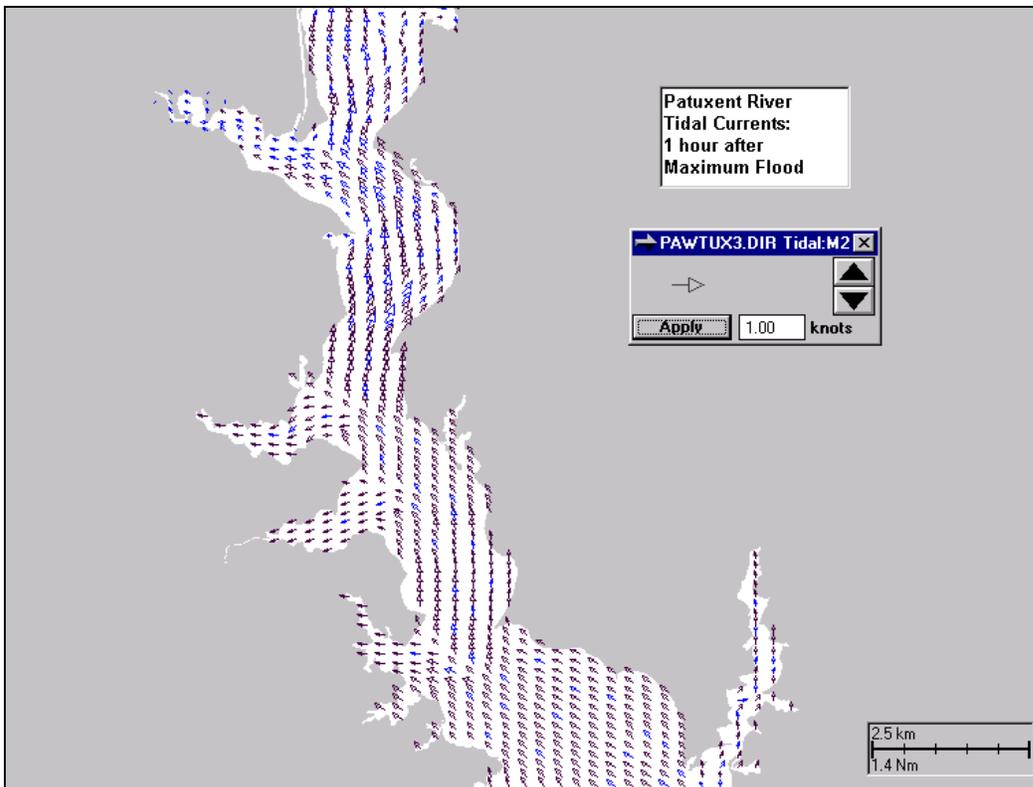

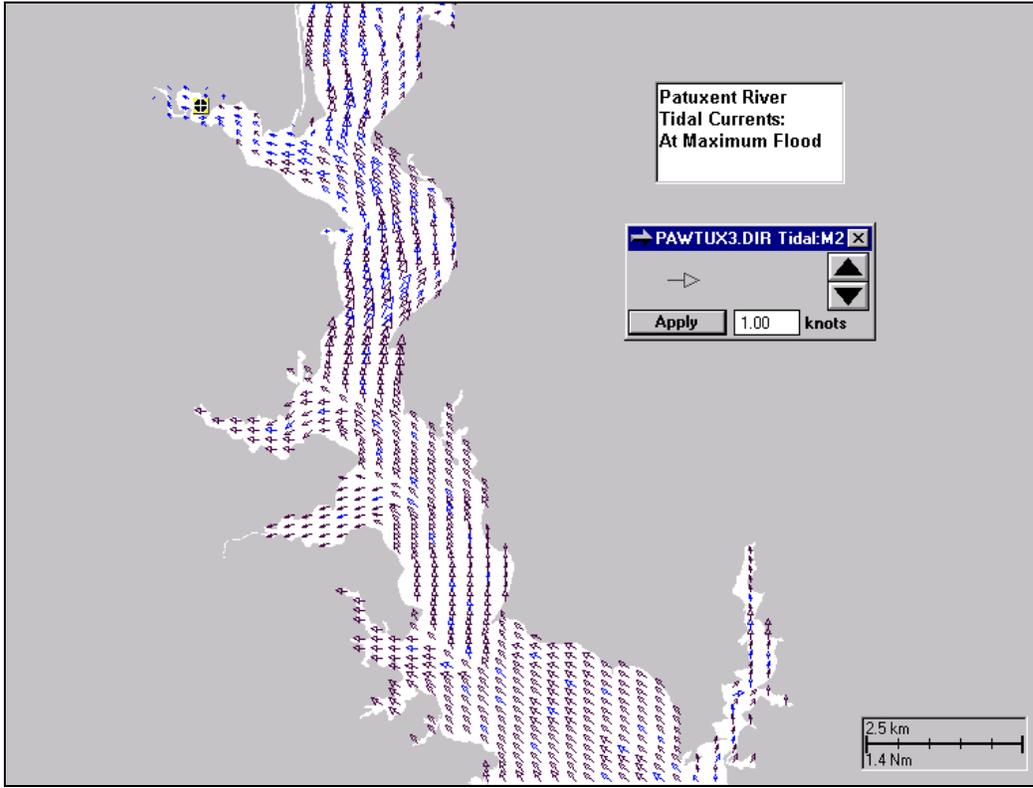

B-1. Tidal Current and Wind Stations

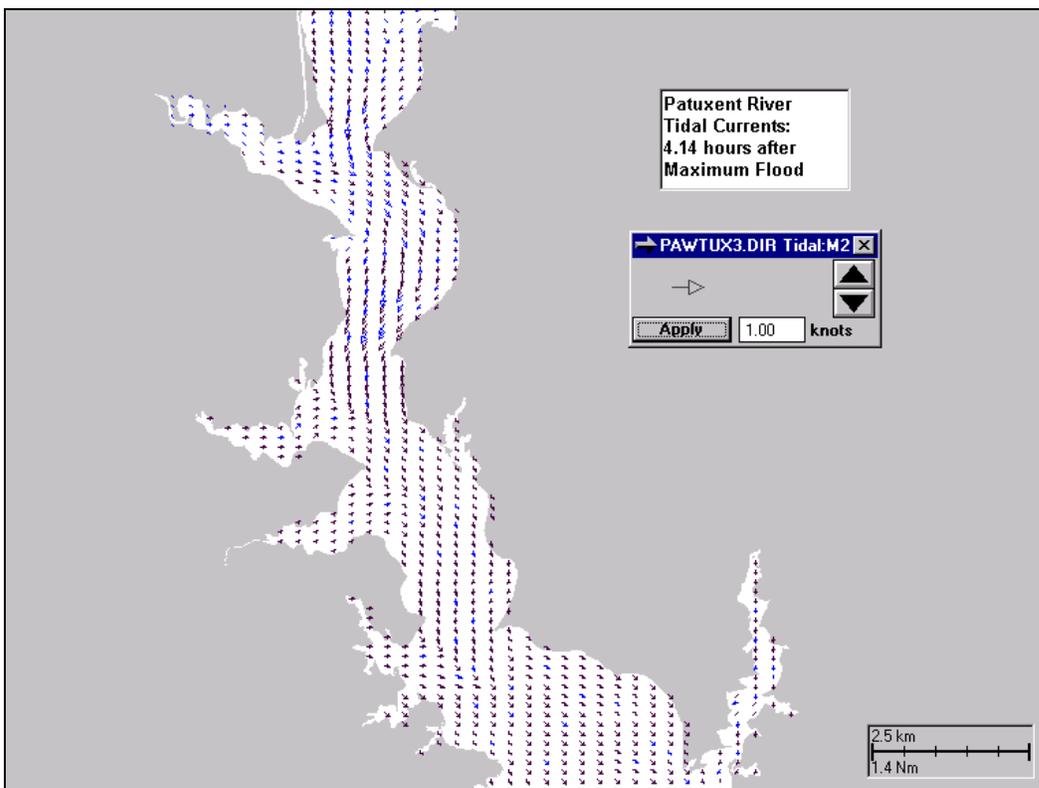

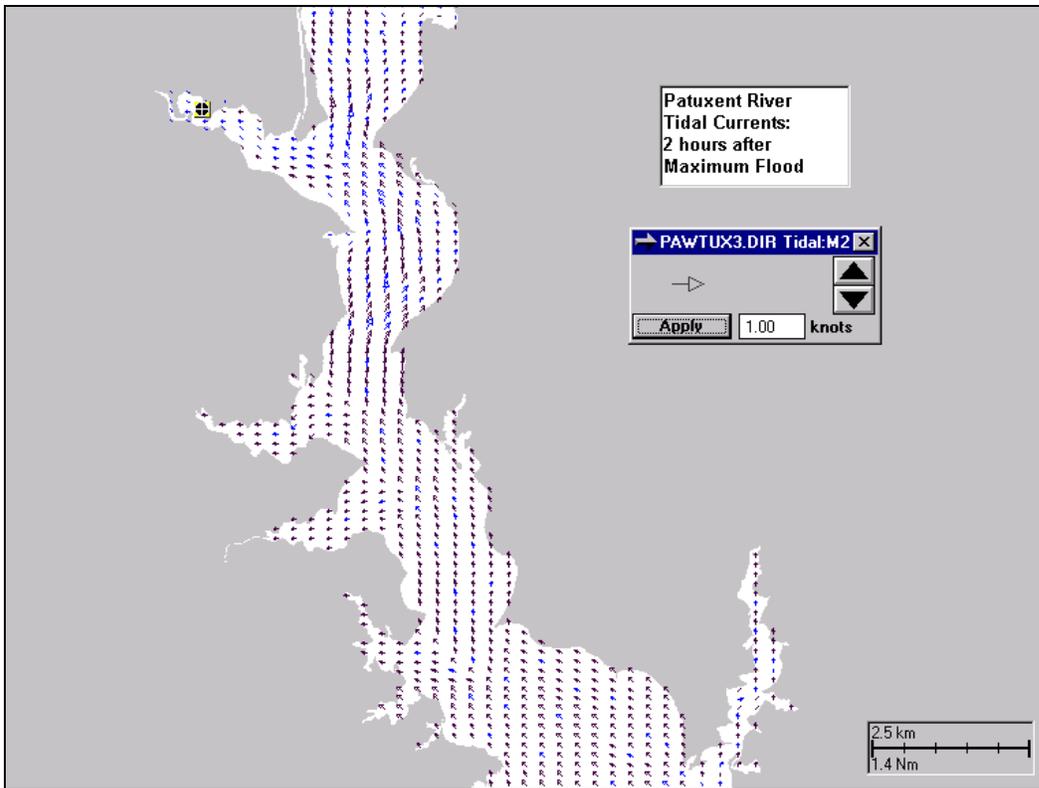

Vectors (speed and direction) of maximum flood currents are available from the commercially available Tides & Currents program at the stations mapped. These data were interpolated to develop a spatially complete map of maximum flood current in all areas of the Patuxent River. The model assumes that maximum ebb current is equal in speed and 180 degrees opposite. Speed changes proportionately between maximum flood and maximum ebb.

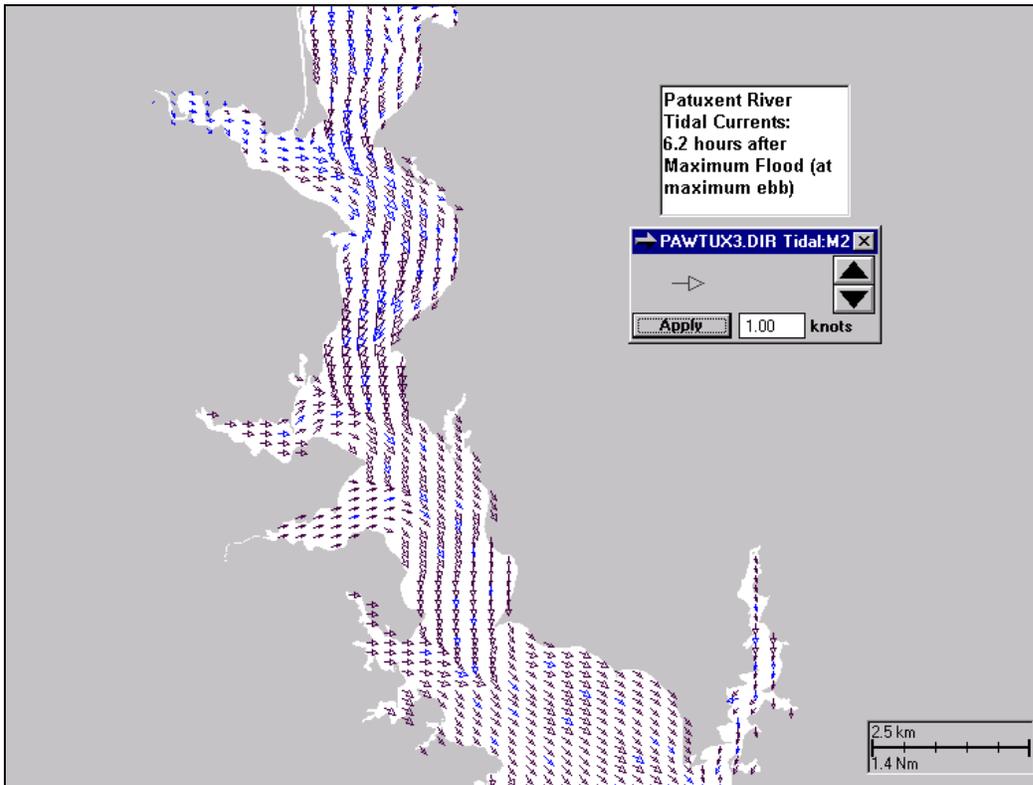

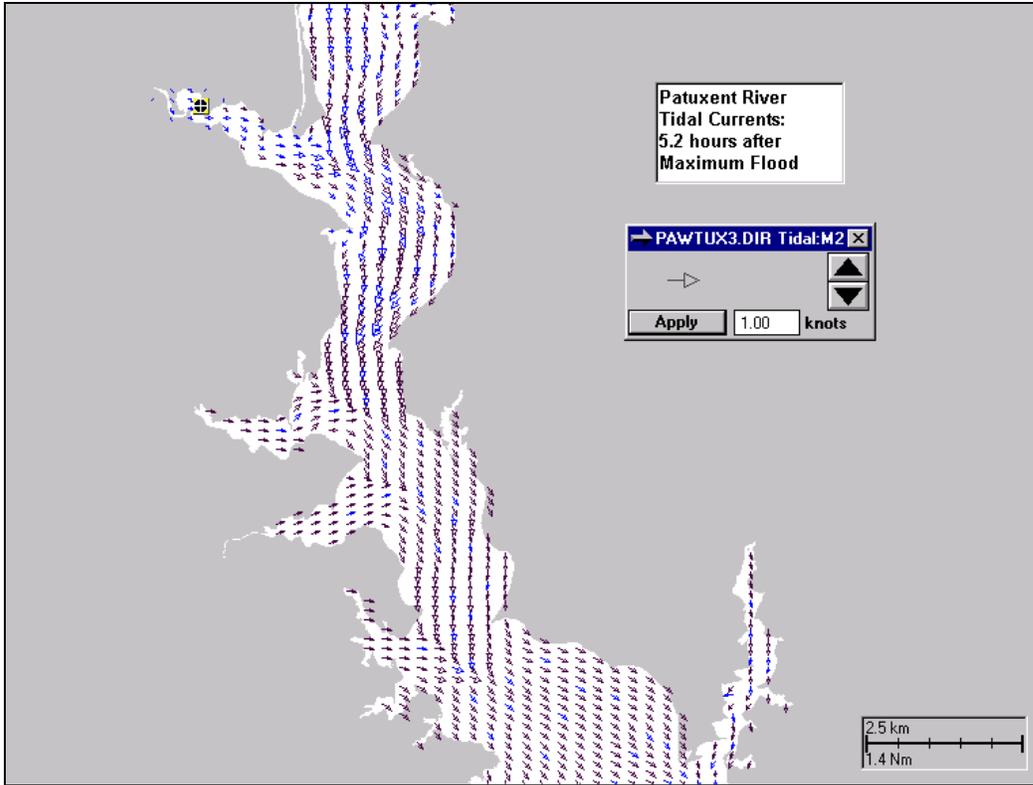

TPLM2EDT.WNE is the wind station where hourly wind speed and direction data were obtained (Appendix C).

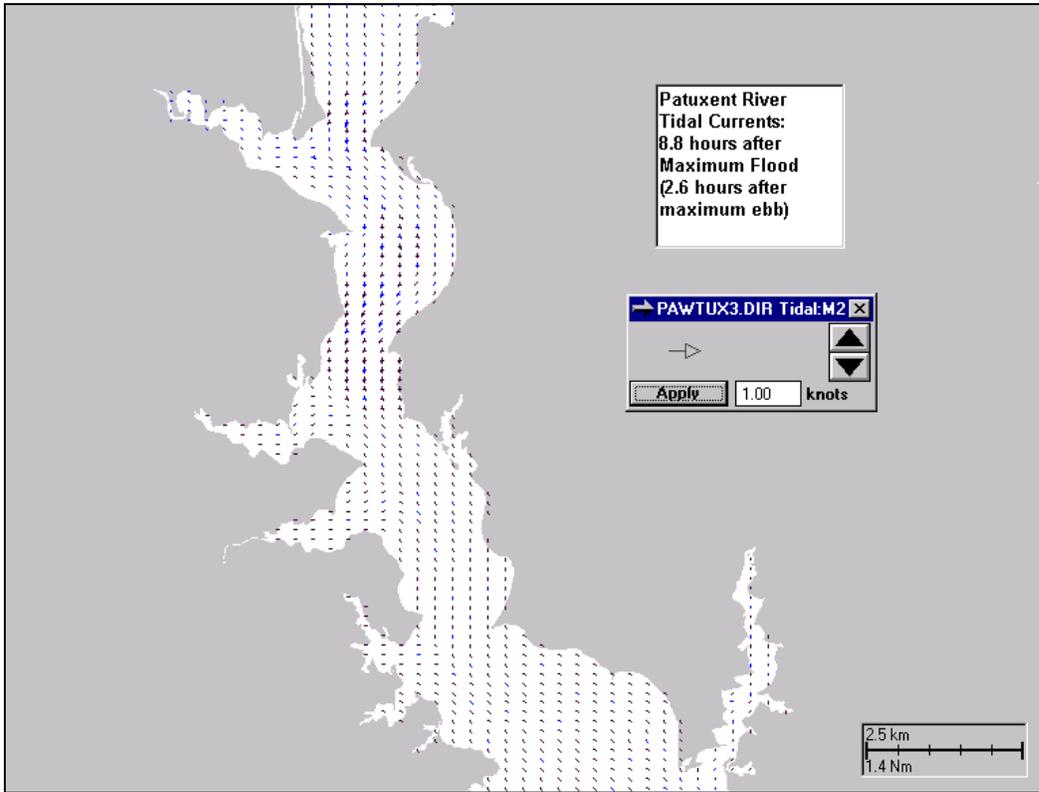

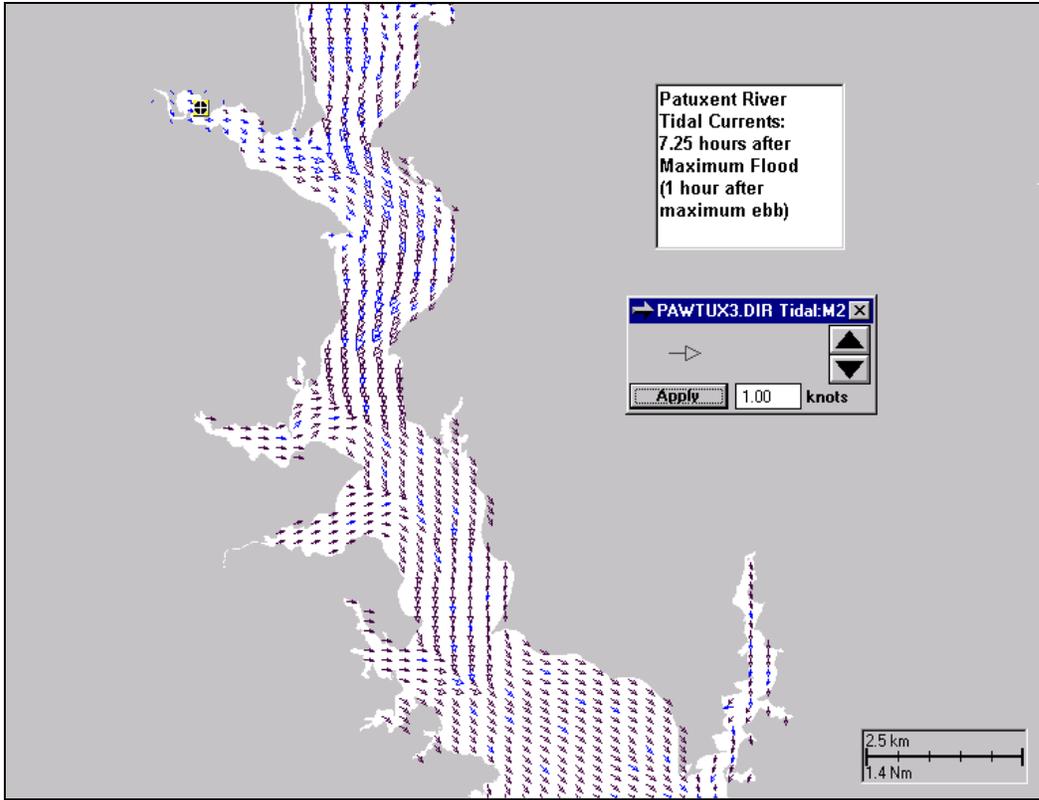

B-2. Current Vectors Used in the Simulations

Appendix C: Hourly Wind Speed and Direction used for the Simulation.

Appendix D. Inputs to the SIMAP Physical Fates Model and PAH Measurements Used to Estimate Toxicity

Table D-1. Assumed inputs to the SIMAP physical fates model.

Name	Description	Units	Source(s) of Information	Value(s)
Spill Site	Location of the spill site	-	Information supplied by Trustees	At PEPCO pipeline in Swansons Creek
Spill Latitude	Latitude of the spill site	Degrees	chart	38° 32.6555'N
Spill Longitude	Longitude of the spill site	Degrees	chart	76° 42.0969'W
Depth of release	Depth below the water surface of the release	m	Information supplied by Trustees	0 m
Start time and date	Date and time the release began	Date, hr,min	Information supplied by Trustees	7 April 2000 17:30 EDT
End time of release	Date and time the release ended	Date, hr,min	Information supplied by Trustees	(Instantaneous spill)
Total spill volume or mass	Total volume (or weight) released	bbl, gal., MT, kg, m ³	Information supplied by Trustees	120,000 gal.
Timing of release(s)	Timing or rate(s) of release over duration of the spill	(volume per time interval)	Information supplied by Trustees	One release, Instantaneous spill
Fraction in surf zone	Fraction of release occurring in surf zone	%	-	0 (not applicable)
Surf height	Height of waves in surf zone during release	m	-	(not applicable)
Duration of high surf	Time period during release in which surf is high	Hours (start, stop)	-	(not applicable)

Oil: name	Oil type or chemical released	(name)	Information supplied by Trustees	No. 5 fuel (mix of No. 6 and No. 2)
Oil: density	Density of the oil or chemical released	g/cm ³ or API	French et al. (1996)	0.93 g/cm ³
Oil: viscosity	Viscosity of the oil released	Centi-poise (cp)	French et al. (1996)	123 cp
Evaporation constants	A1 - Intercept Henry's Law vs. T; B1 - Slope Henry's Law v. T; To-- Init. Boiling Pt.(deg. K); Tg--Gradient Distillation Curve	deg. K	Data from Whitarcar et al., (1992) for Bunker C	A1 = 27.5 B1 = 22.066 To = 582.3 Tg = 141.51
Other physical properties of the oil	(These have little influence on the model results)	-	French et al. (1996)	(refer to reference cited)
Oil: non-aromatic volatile fraction	Fraction of oil which is not aromatic and with boiling point <340°C (will volatilize)	fraction	French et al. (1996)	23.4%
Oil: BTEX fraction	Fraction of oil which is monoaromatics (BTEX)	fraction	BTEX analysis of source oil(s)	0 (assumed, not measured)
Oil: PAH fraction	Fraction of oil which is 2-3 ring aromatics (PAHs)	fraction	analysis of source oil (ENTRIX)	3.35 %
Oil: initial water fraction	Fraction of initial spill volume which is water	fraction	(assumed)	0
Oil: water fraction in mousse	Fraction of oil mousse which is water	fraction	French et al. (1996)	0%

Salinity	Surface water salinity	ppt	Measurement Apr 4, 2000 east of Indian Creek	8ppt
Water Temperature	Surface water temperature	Deg.C	Measurement Apr 4, 2000 east of Indian Creek	14°C
Air Temperature	Air water temperature at water surface	Deg.C	(assume = water temperature)	14°C
Wind drift speed	Speed oil moves down wind relative to wind	% of wind speed	Youssef (1993); Youssef and Spaulding (1993)	Calculated in model using this algorithm
Wind drift angle	Angle to right of wind (in northern hemisphere) that oil drifts	Deg. to right of down wind	Youssef (1993); Youssef and Spaulding (1993)	Calculated in model using this algorithm
Horizontal dispersion coefficient	Randomized turbulent dispersion parameter in x & y	m ² /sec	French et al. (1996, 1999) based on Okubo (1971)	1 m ² /sec (estuaries and low energy coastal areas)
Vertical dispersion coefficient	Randomized turbulent dispersion parameter in z	m ² /sec	French et al. (1996, 1999) based on Okubo (1971)	0.0001 m ² /sec
Suspended sediment concentration	Average suspended sediment concentration during spill period	mg/l	French et al. (1996)	10 mg/l
Suspended sediment settling rate	Net settling rate for suspended sediments	m/day	French et al. (1996)	1 m/day

Table D-2. PAH concentrations measured in the source oil (pipeline sampled April 19, 2000; data provided by ENTRIX, 2000) and dissolved in water if assumed partitioned at equilibrium between oil droplets and water. Oil-water partition coefficient (K_d) is estimated from K_{ow} using the regression in Lee et al (1992): $\log(K_d) = 0.93 \cdot \log(K_{ow}) + 0.68$. Estimates of $\log(K_{ow})$ are from Mackay et al. (1992) and Neff and Burns (1996).

Aromatic (PAHs)	Mol. Wt. (g/ mole)	Log(K_{ow})	Concentration in oil (mg/kg)	Dissolved Concentration at Equilibrium (mg/L)
naphthalene	128	3.37	922.0	0.1415
C1-naphthalenes	142	3.87	5740.0	0.3019
C2-naphthalenes	156	4.37	6330.0	0.1141
C3-naphthalenes	170	5.00	5090.0	0.0238
C4-naphthalenes	185	5.55	2970.0	0.0043
biphenyls	154	3.9	231.0	0.0114
acenaphthylene	152	4.07	0.9	0.0000
acenaphthene	154	3.92	154.0	0.0073
Fluorene	166	4.18	270.0	0.0073
C1-fluorenes	181	4.97	813.0	0.0041
C2-fluorenes	196	5.20	1430.0	0.0044
C3-fluorenes	211	5.50	1350.0	0.0022
phenanthrene	178	4.57	77.2	0.0009
anthracene	178	4.54	711.0	0.0089
C1-phenanthrenes/anthracenes	192	5.14	2330.0	0.0081
C2-phenanthrenes/anthracenes	207	5.25	3290.0	0.0090
C3-phenanthrenes/anthracenes	222	6.00	2880.0	0.0016
C4-phenanthrenes/anthracenes	237	6.51	1630.0	0.0003
dibenzothiophene	184	4.49	107.0	0.0015
C1-dibenzothiophene	199	4.86	428.0	0.0027
C2-dibenzothiophene	214	5.50	821.0	0.0013
C3-dibenzothiophene	228	5.73	756.0	0.0007
fluoranthene	202	5.22	66.3	0.0002
pyrene	202	5.18	348.0	0.0011
Total			33479.4	0.6558

Table D-3. Estimated LC50s for total dissolved aromatic mixture based on the source oil data in Table D-2, using literature data-derived QSARs from French McCay (2001) and including only aromatics with $\log(K_{ow}) \leq 5.6$. The QSARs are:

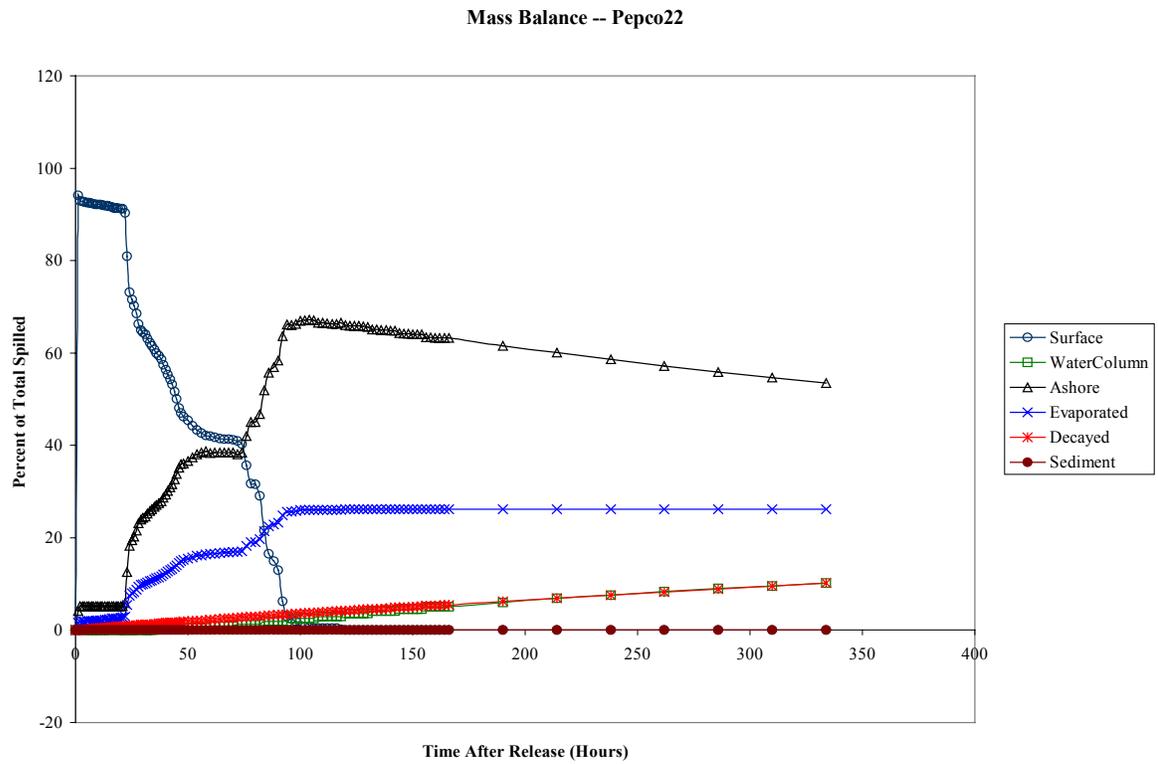

Average species: $\log(LC50_{\infty}) = 4.8926 - 1.0878 * \log(K_{ow})$

Sensitive species: $\log(LC50_{\infty}) = 3.9704 - 1.0878 * \log(K_{ow})$

Insensitive species: $\log(LC50_{\infty}) = 5.8147 - 1.0878 * \log(K_{ow})$

Concentration in Water	Average species	Sensitive Species	Insensitive Species
Assumed equal to neat oil	45	5	378
Dissolved at equilibrium	223	27	1863

Appendix E. Mass Balance of the Fate of the Oil over Time

Modeled Percent of Spilled Mass over Time after the Spill

Appendix F. Modeled Oil Trajectory over Time

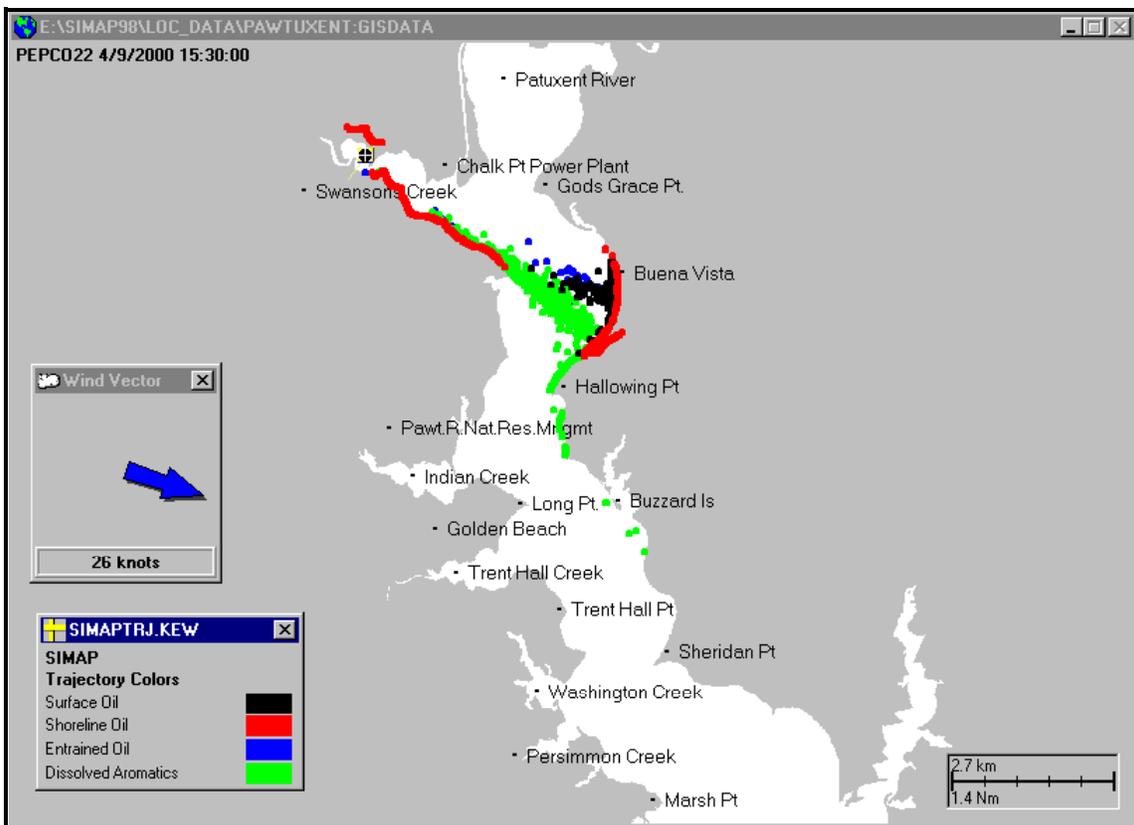

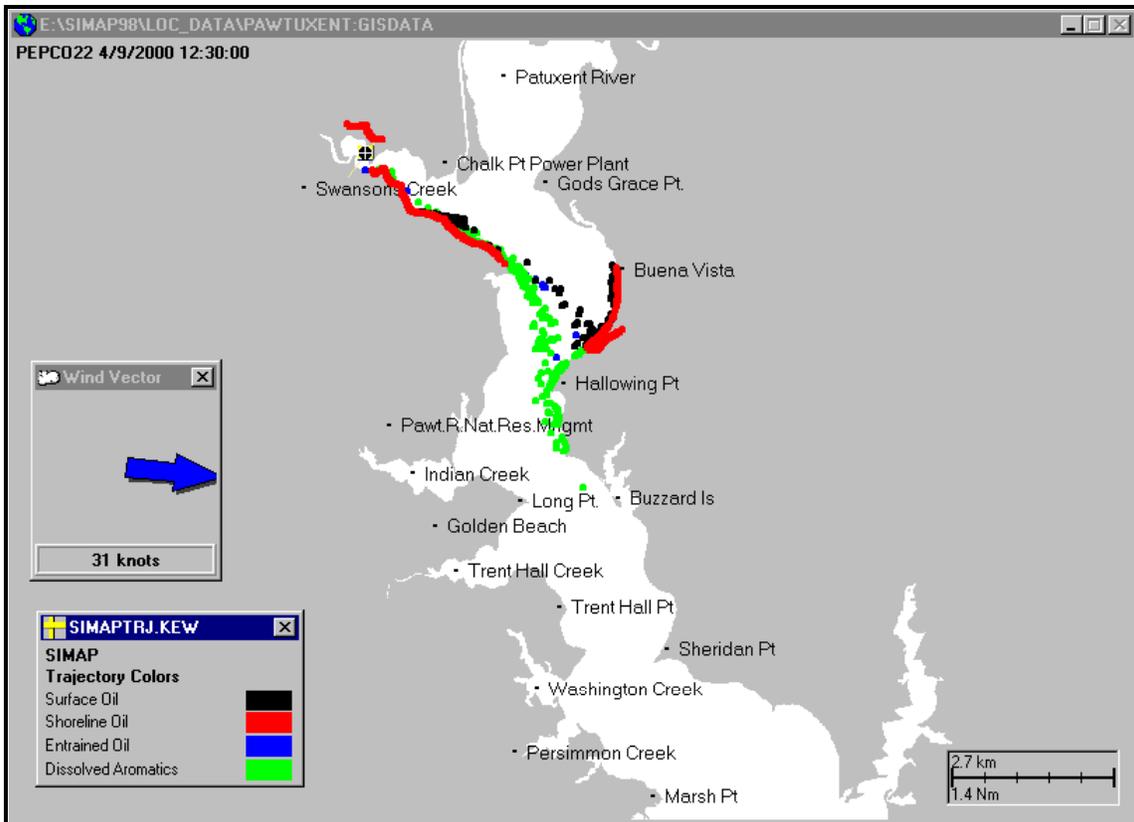

The following figures show the model trajectory for the spill. The points on the plots represent the center of mass for “spilletts” used to simulate the spill. Each spillet is a subplot of the total mass spilled. The spillet is transported by currents and surface wind drift when in the top 5m of the water. The mass distribution around the spillet center spreads (for surface slicks) and disperses over time according to the horizontal and vertical dispersion coefficients. Concentrations at a given time are calculated from the mass distribution of all spilletts.

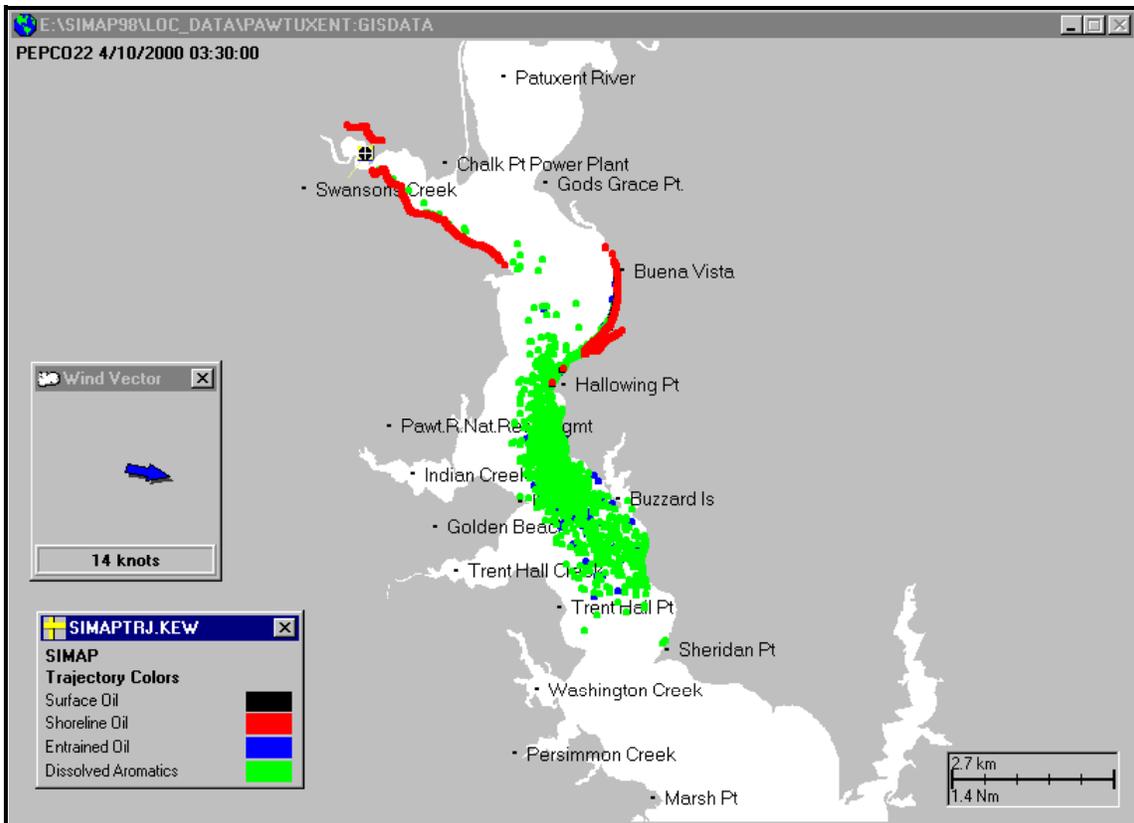

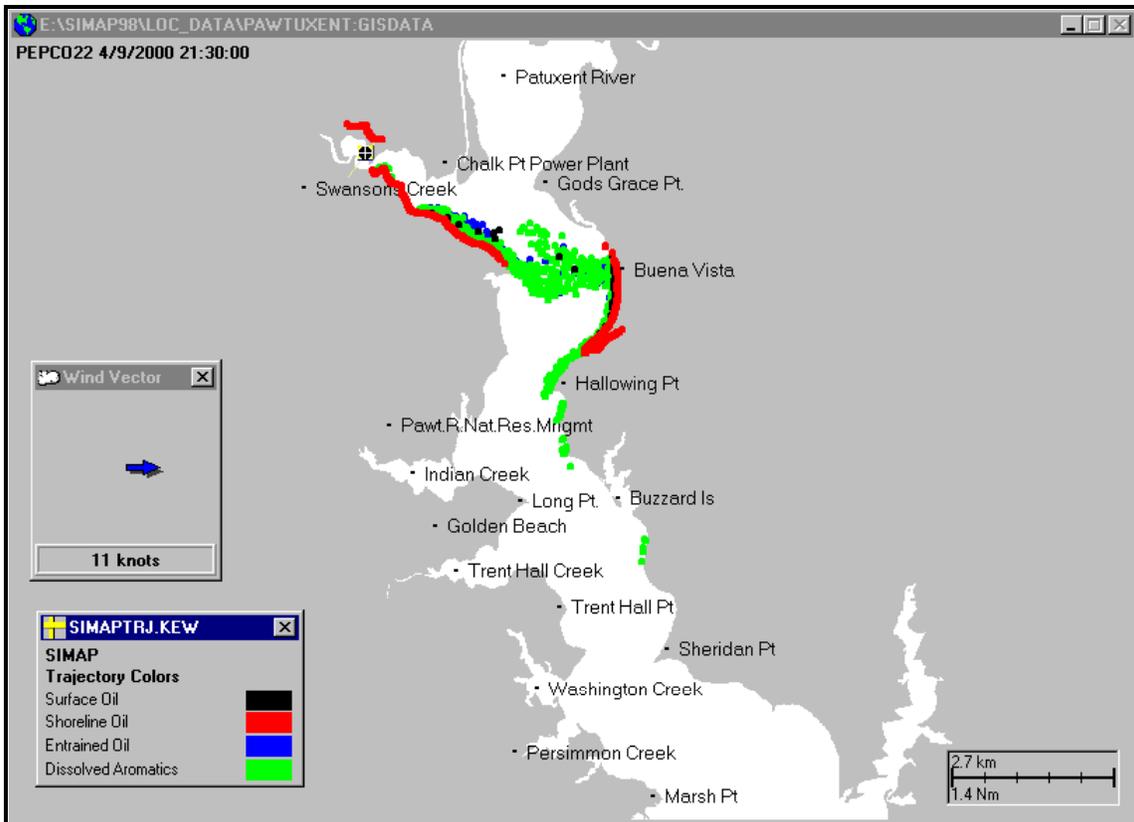

Note that the shoreline shown in these model outputs are for visual reference only, whereas the habitat (and corresponding depth) grid (Appendices B and C) defines the actual shoreline to the model.

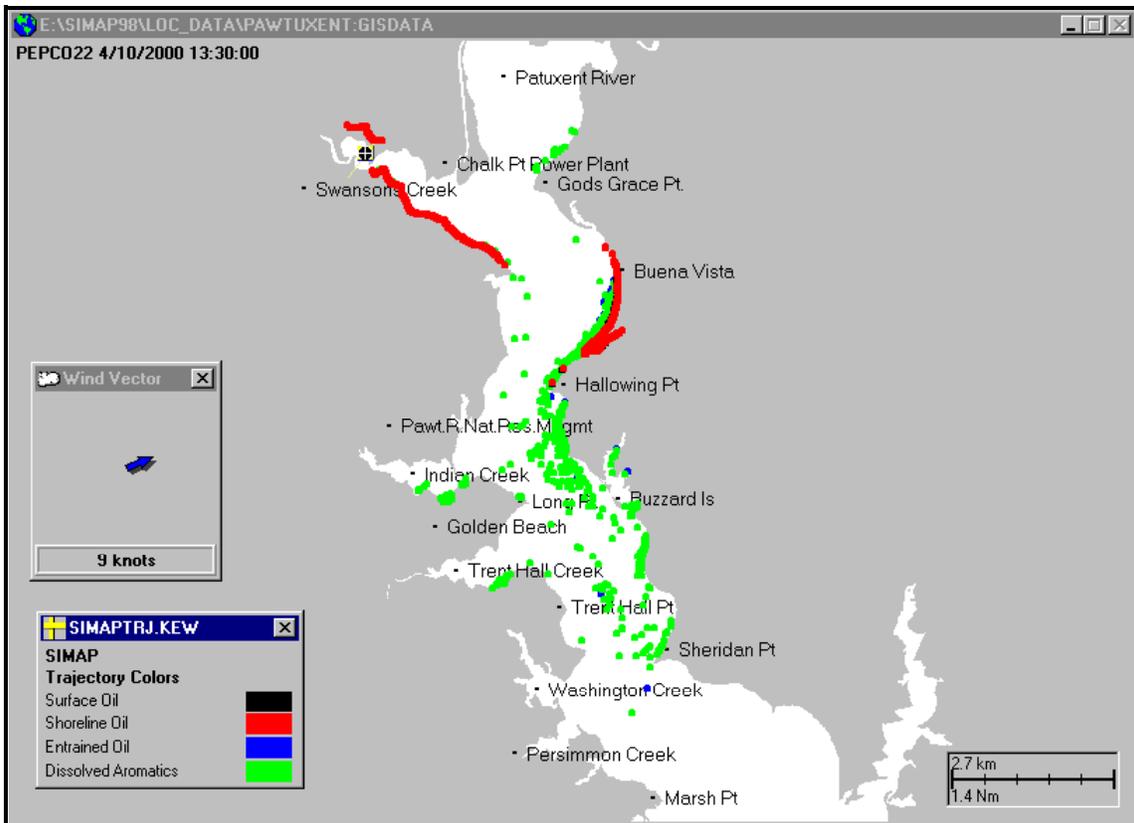

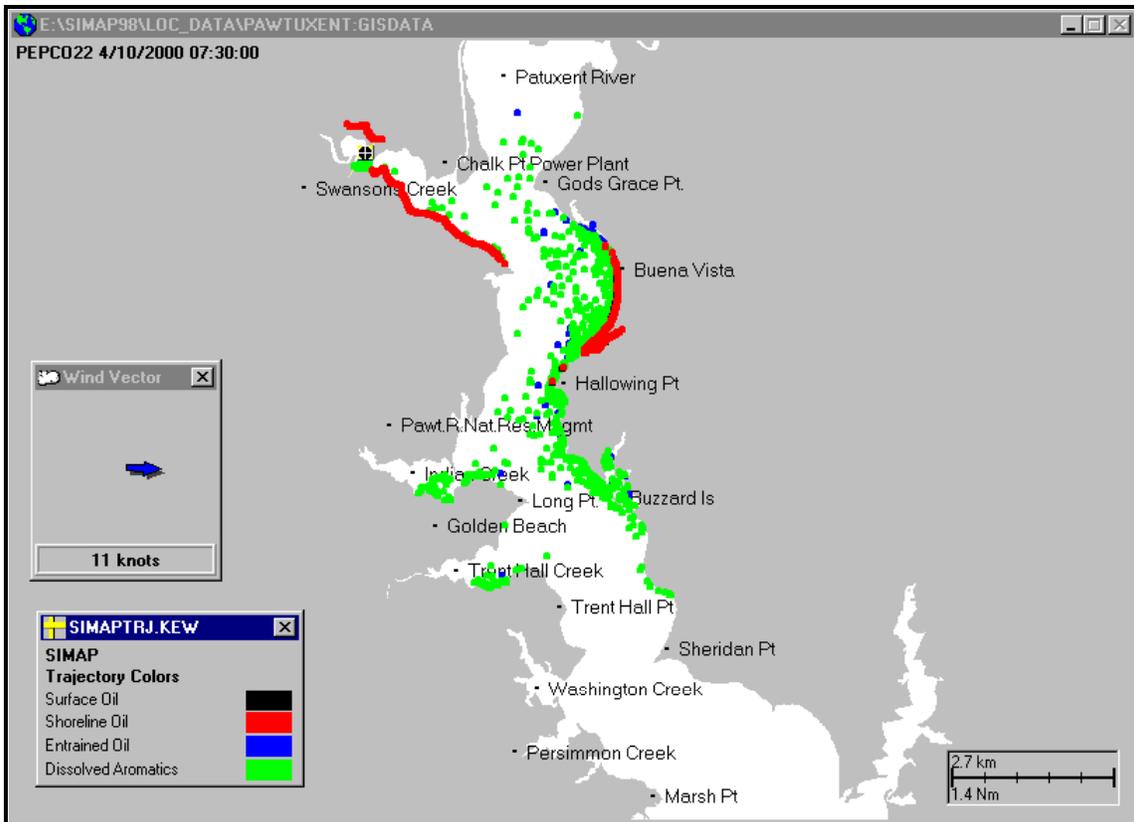

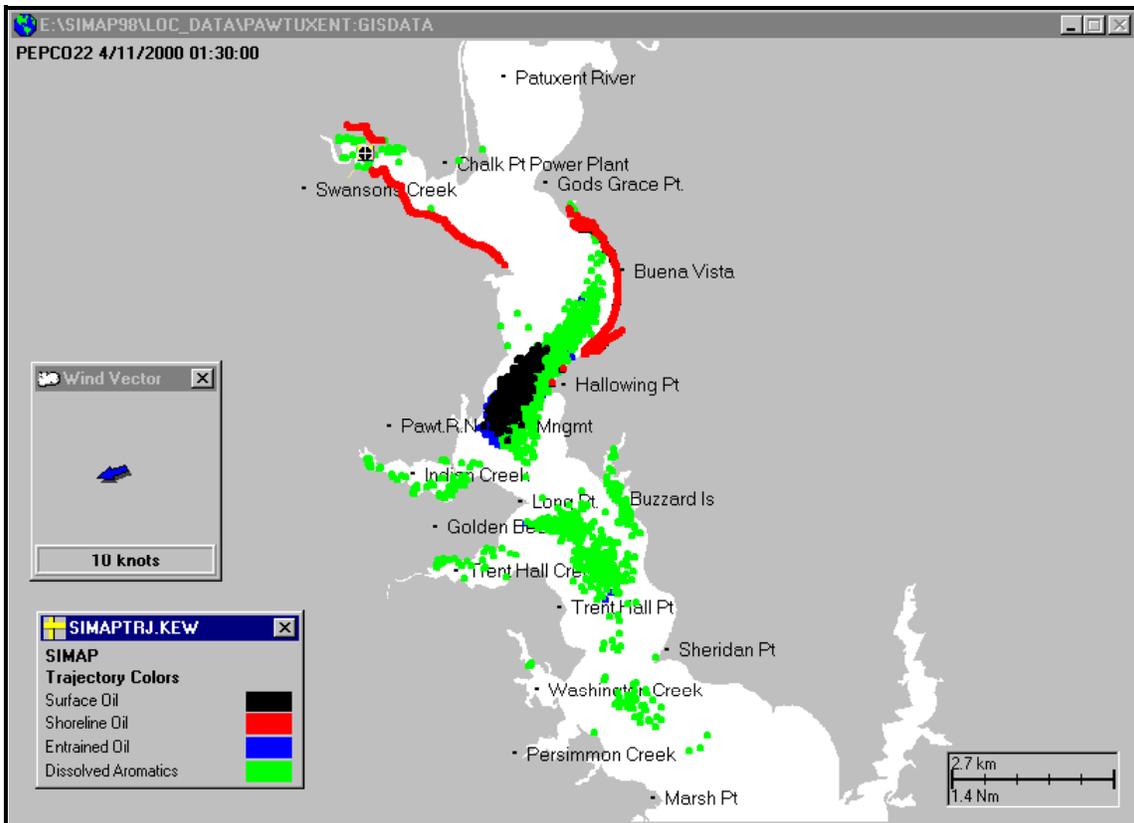

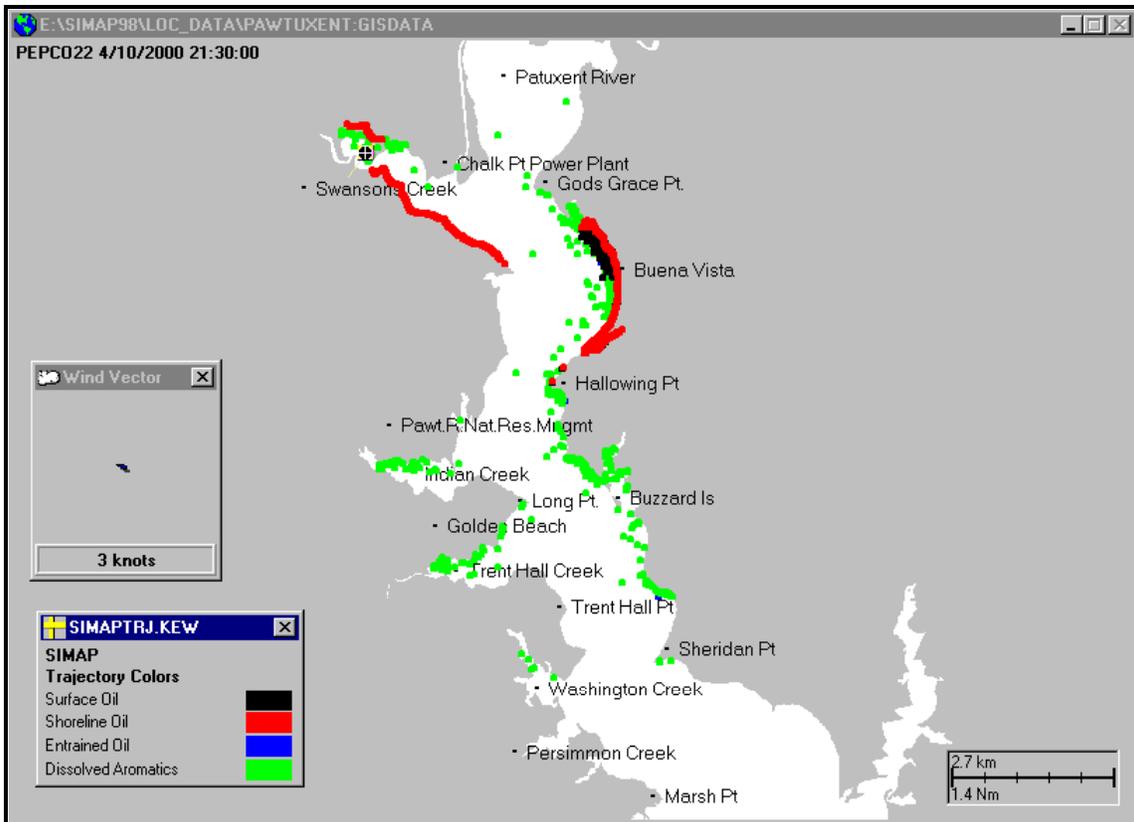

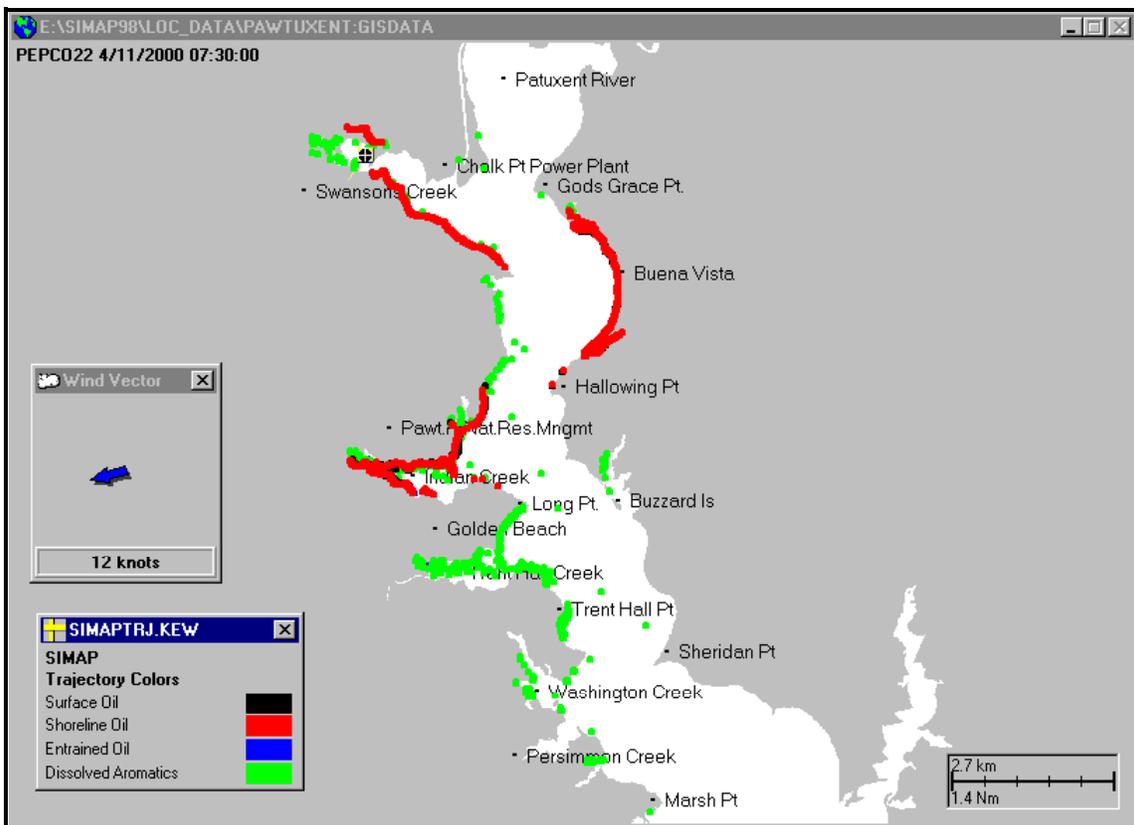

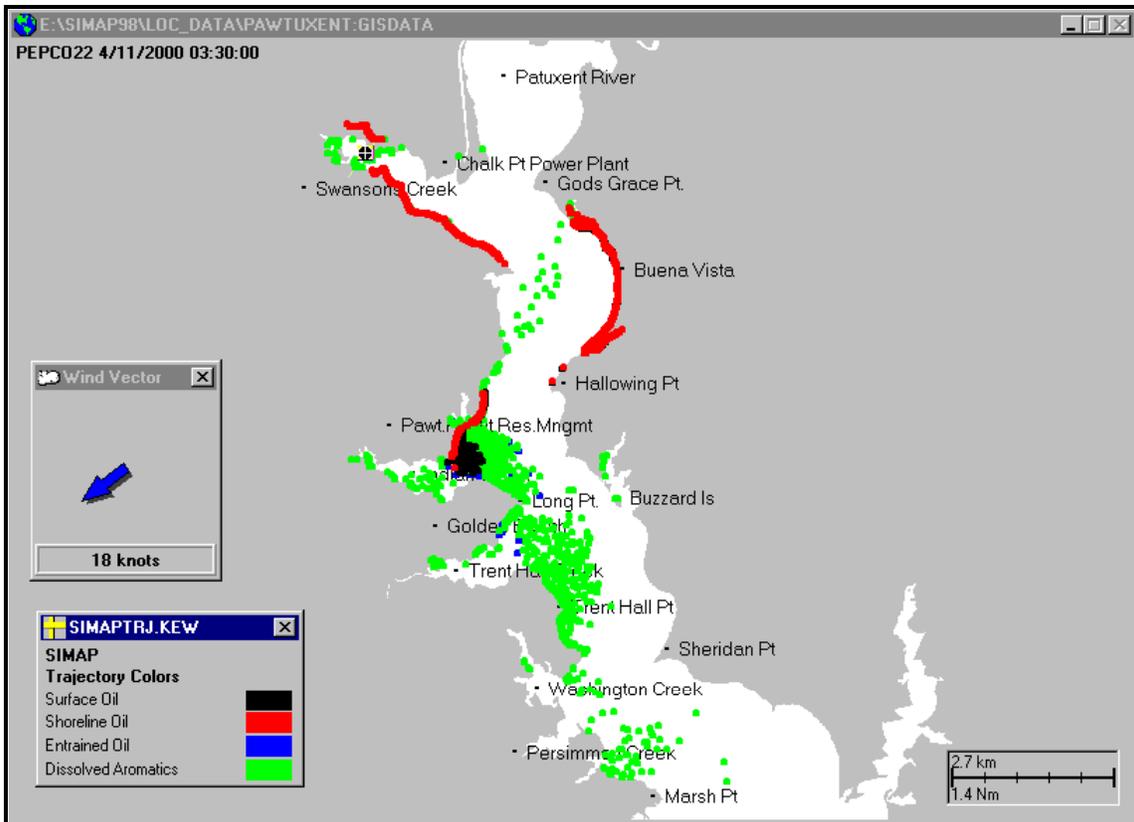

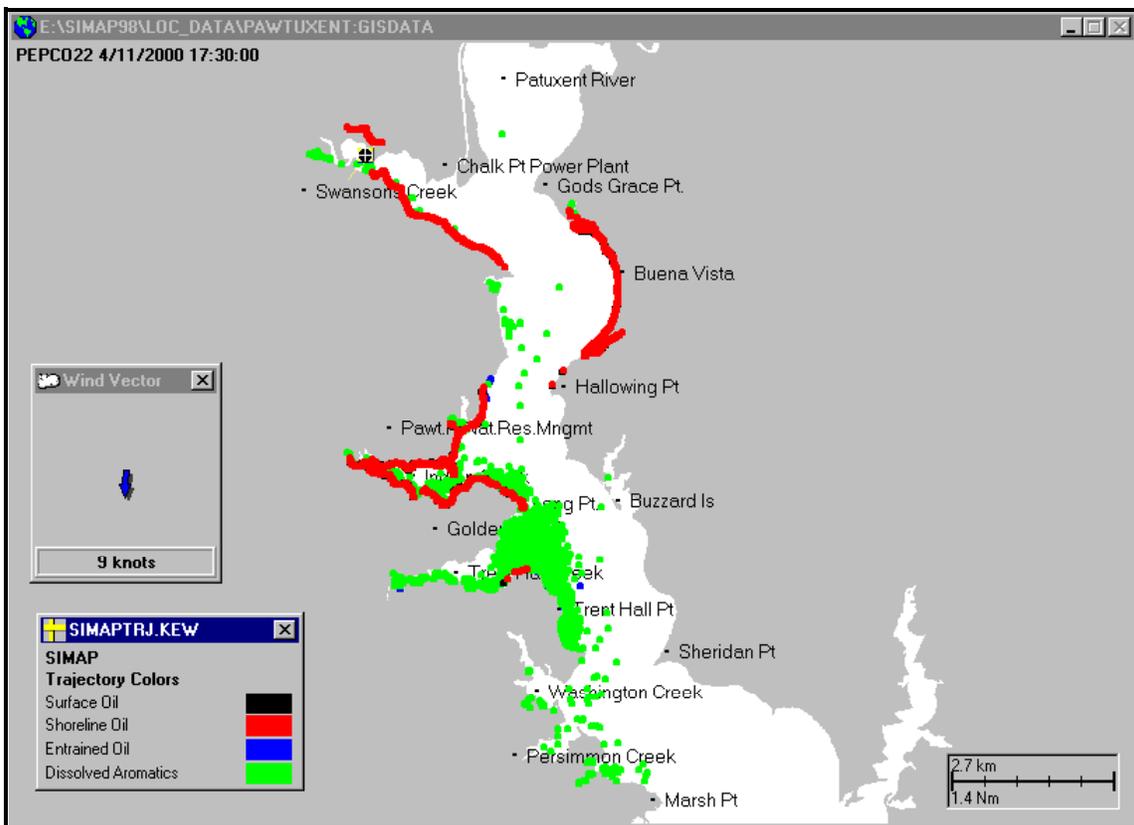

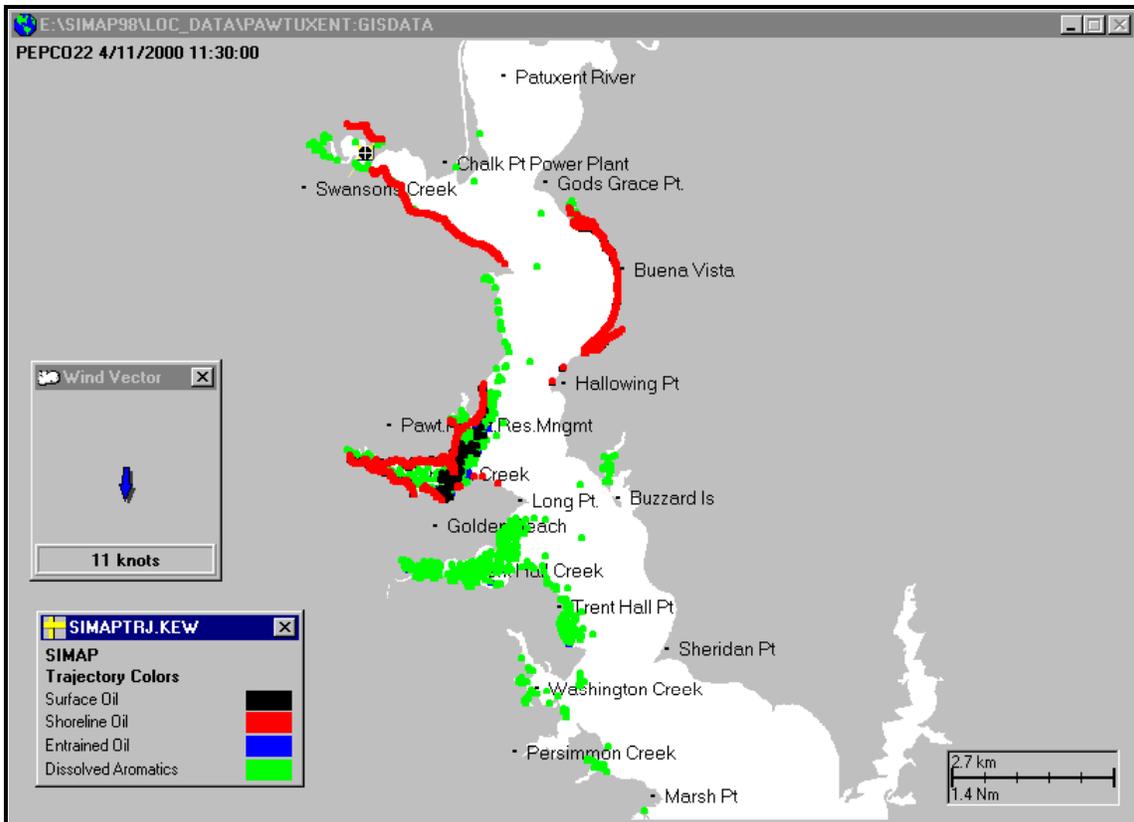

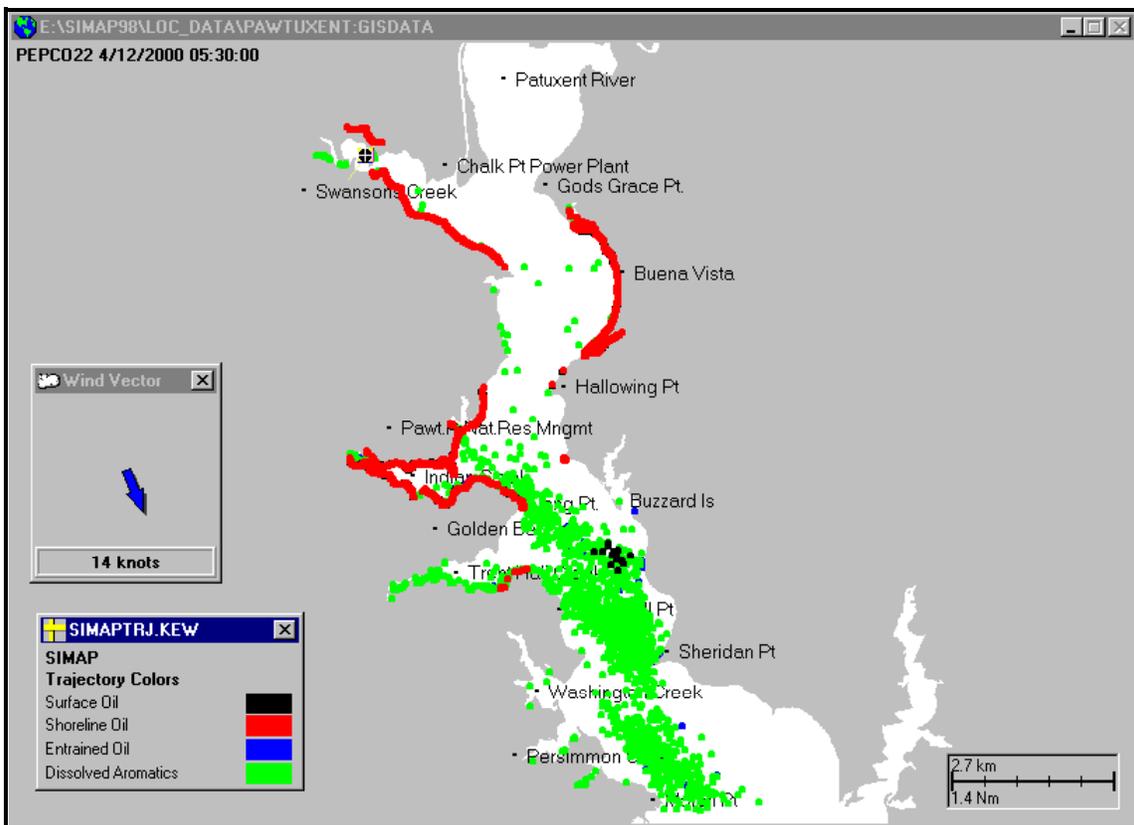

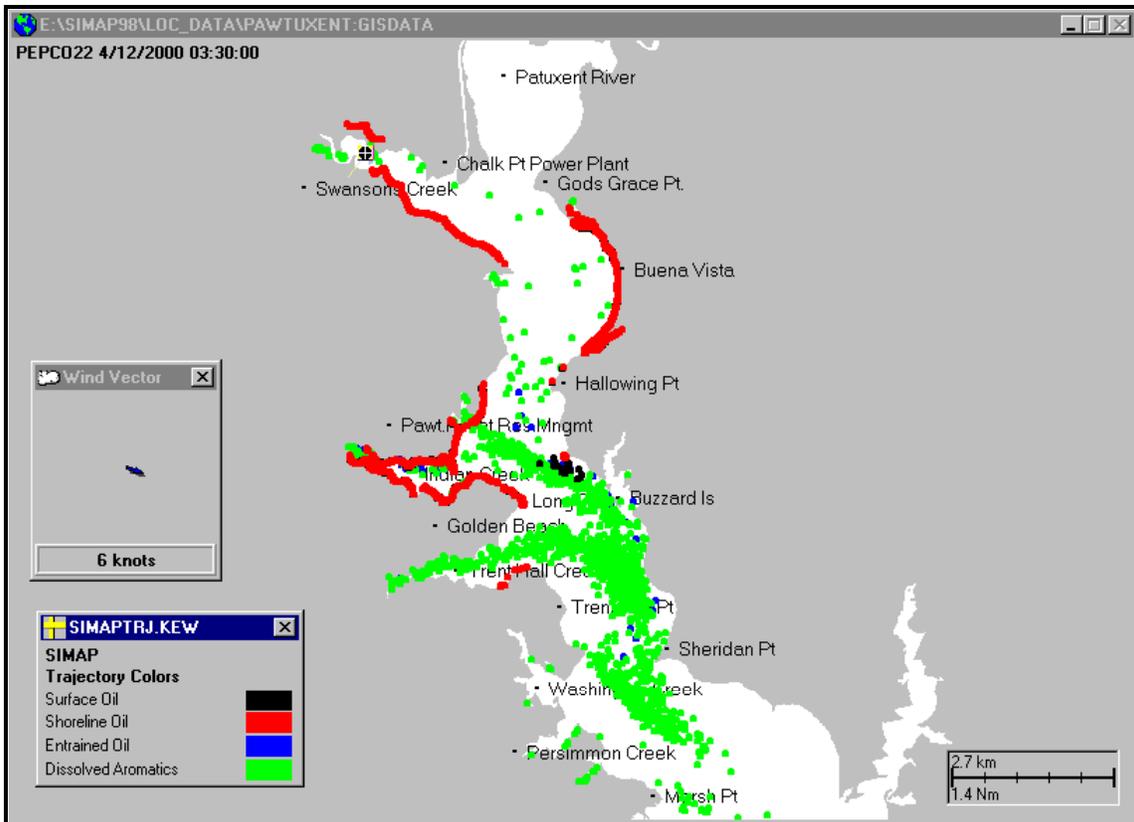

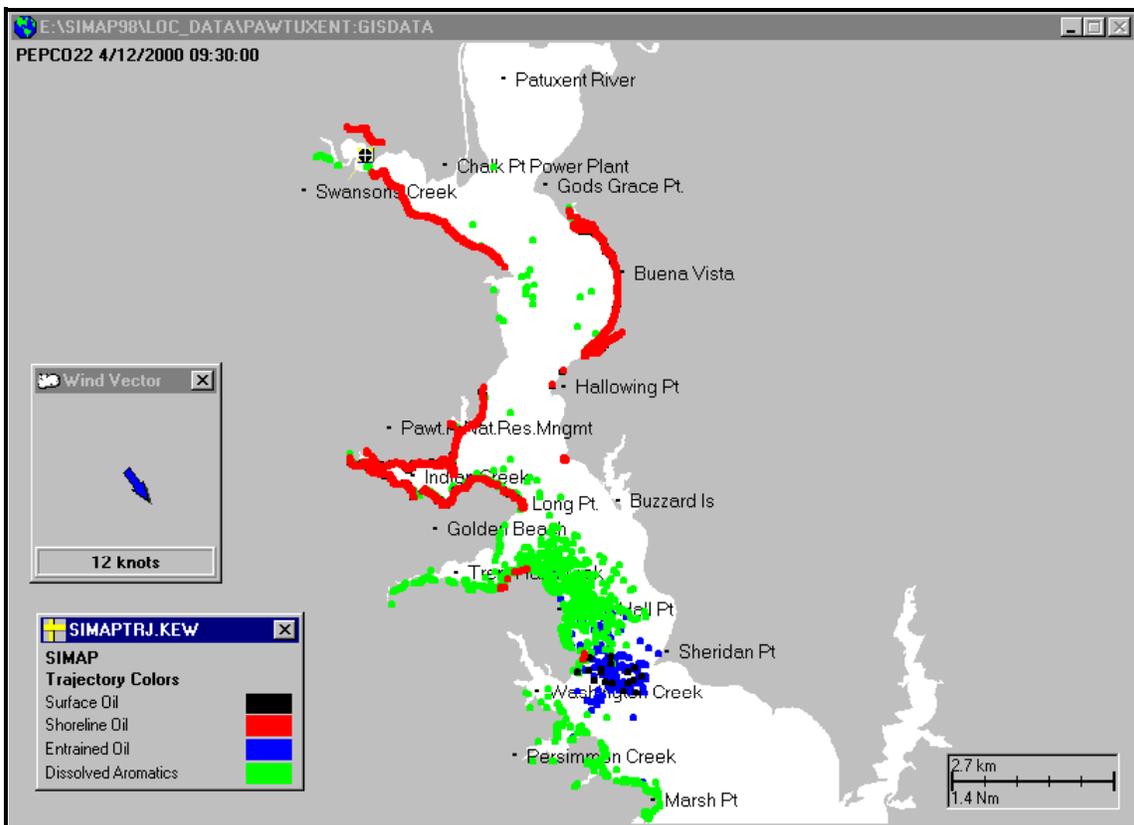

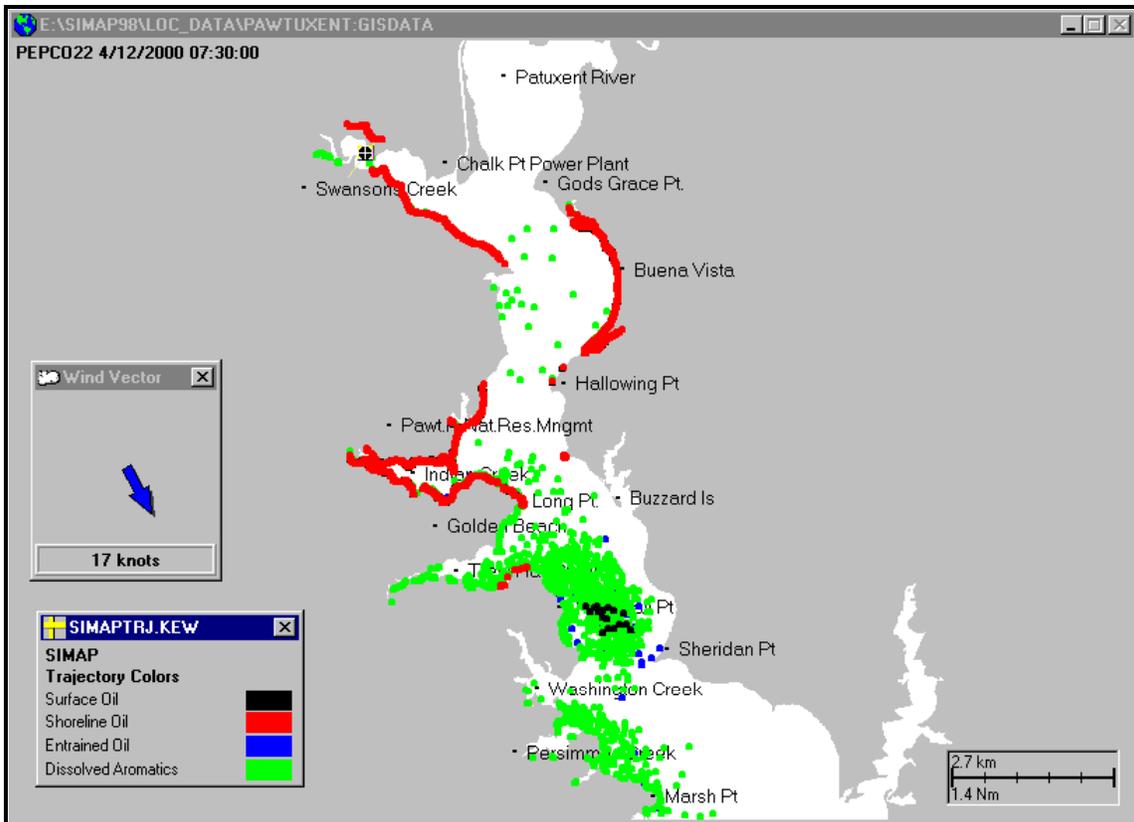

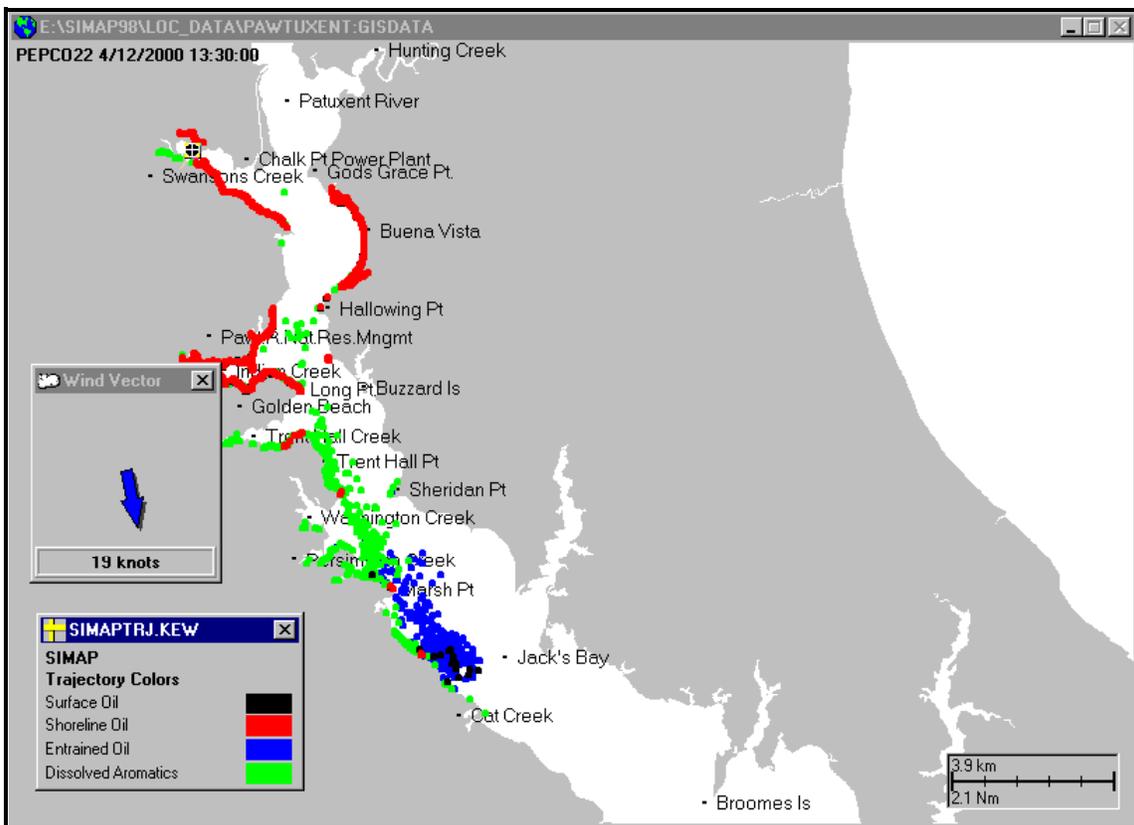

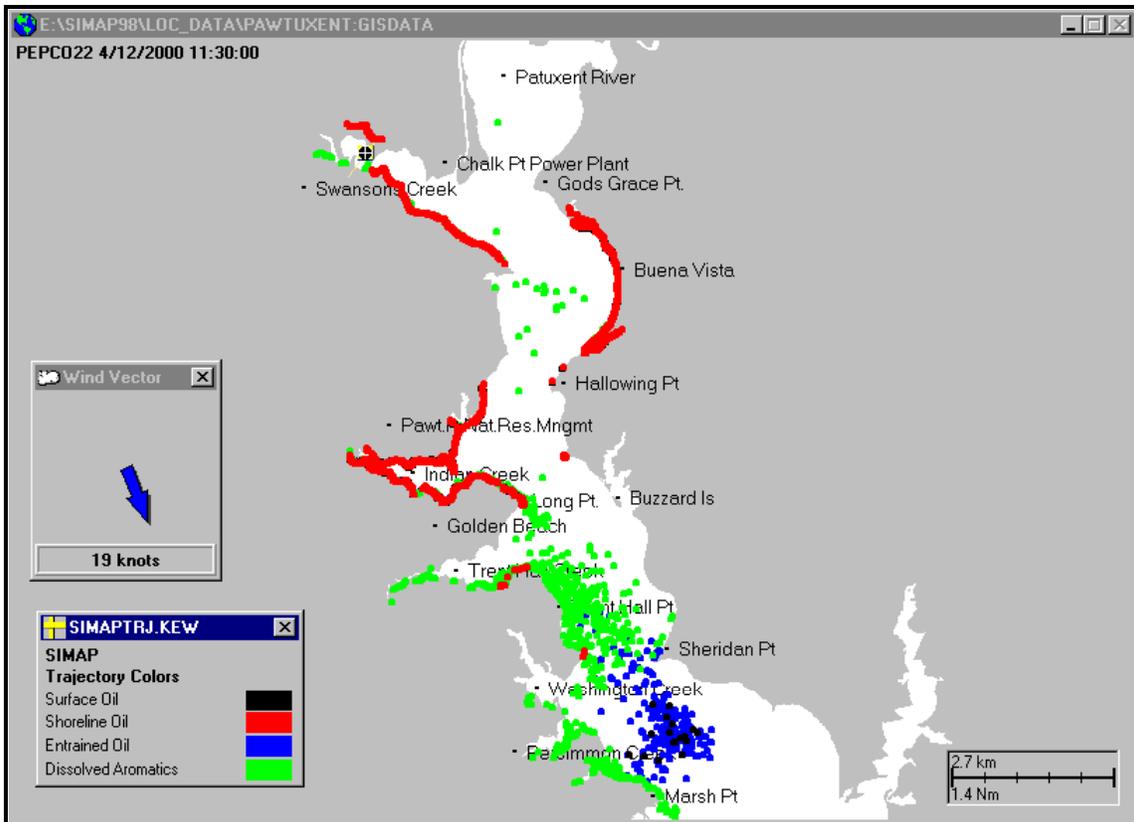

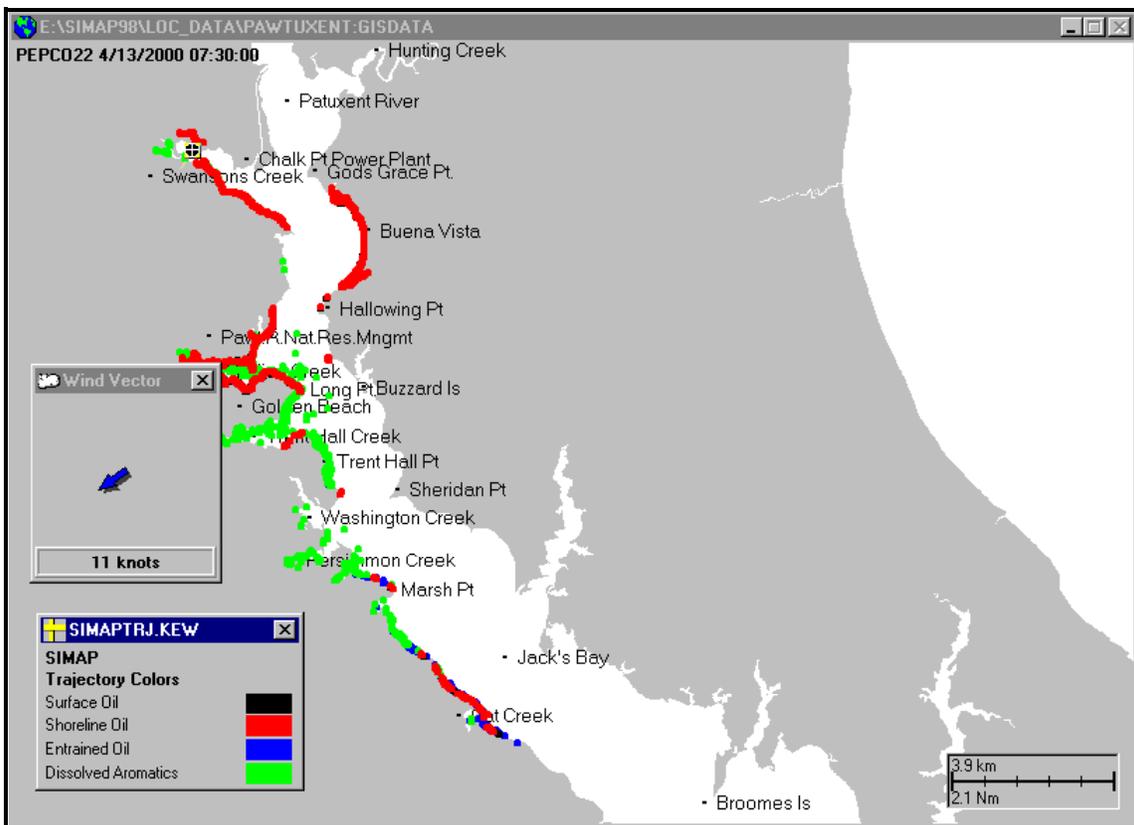

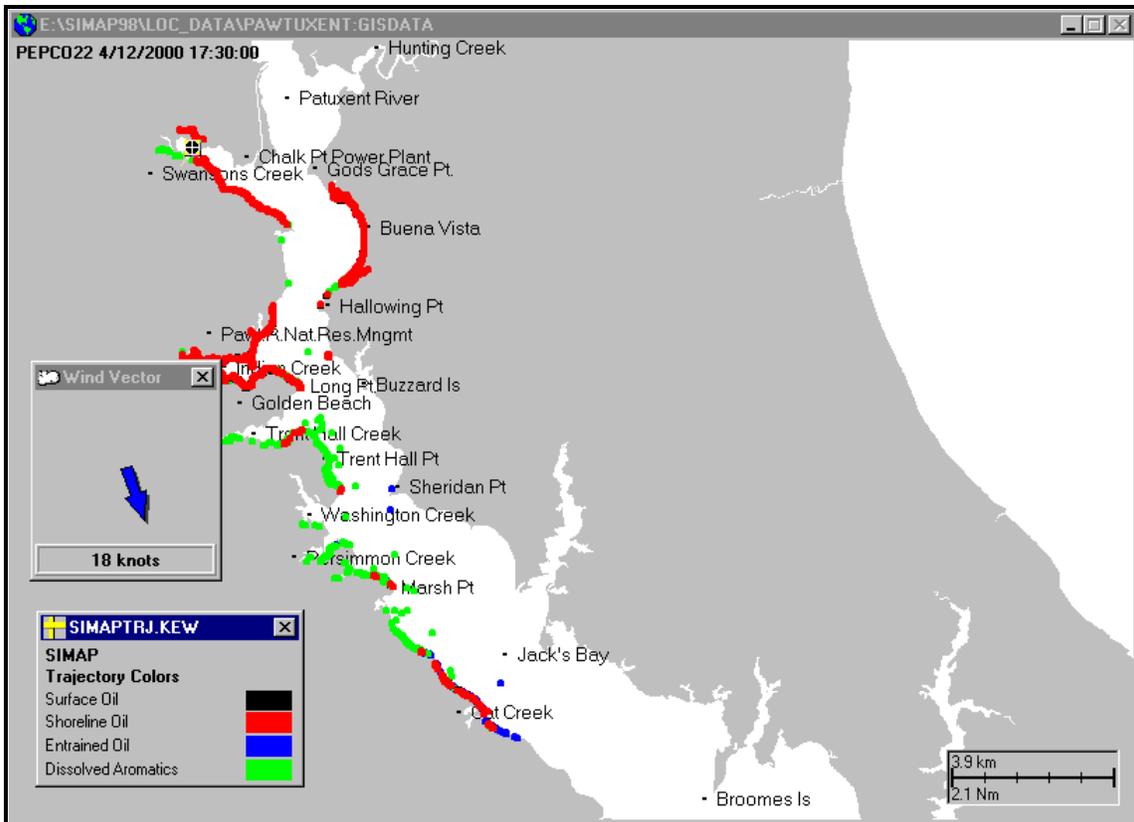

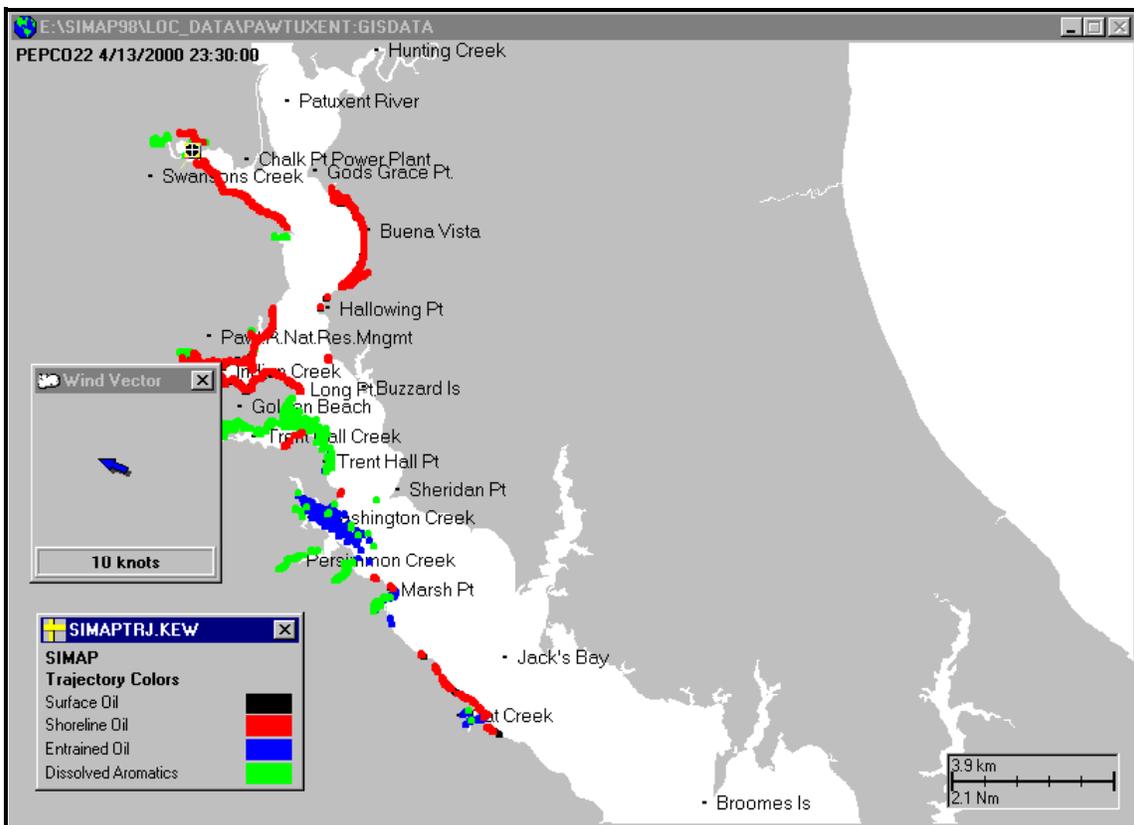

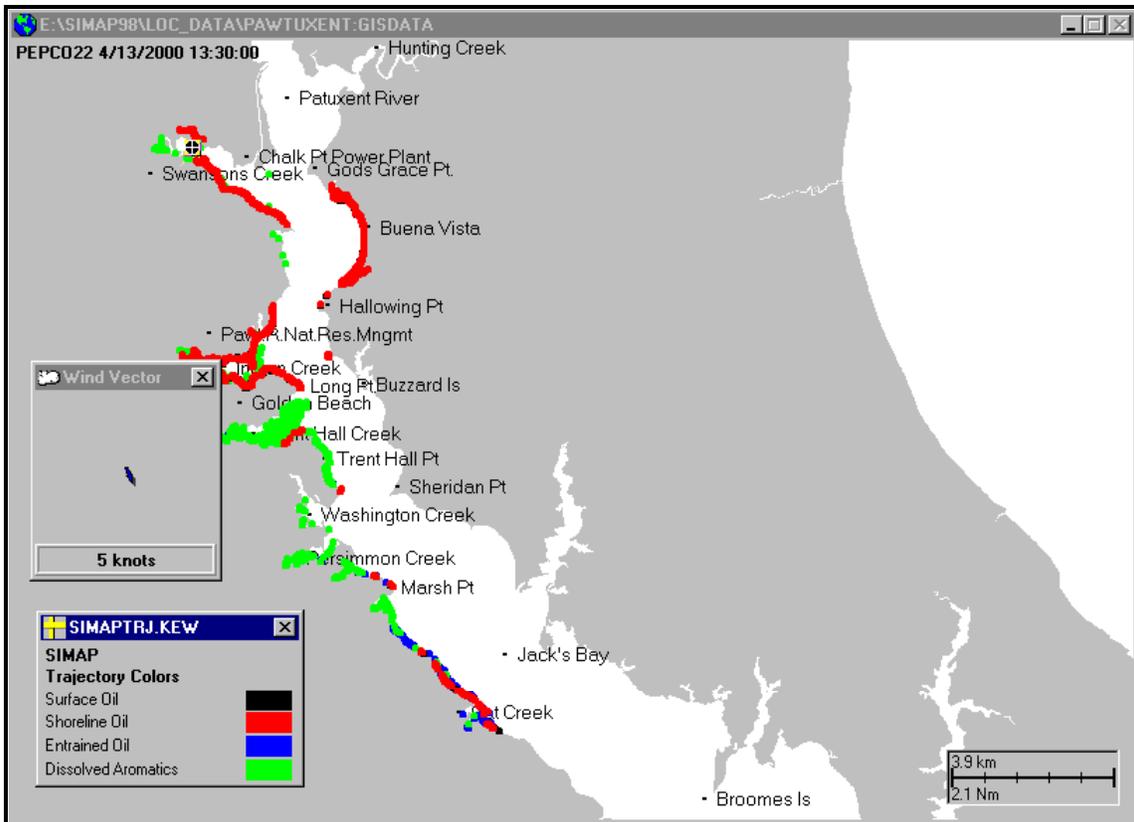

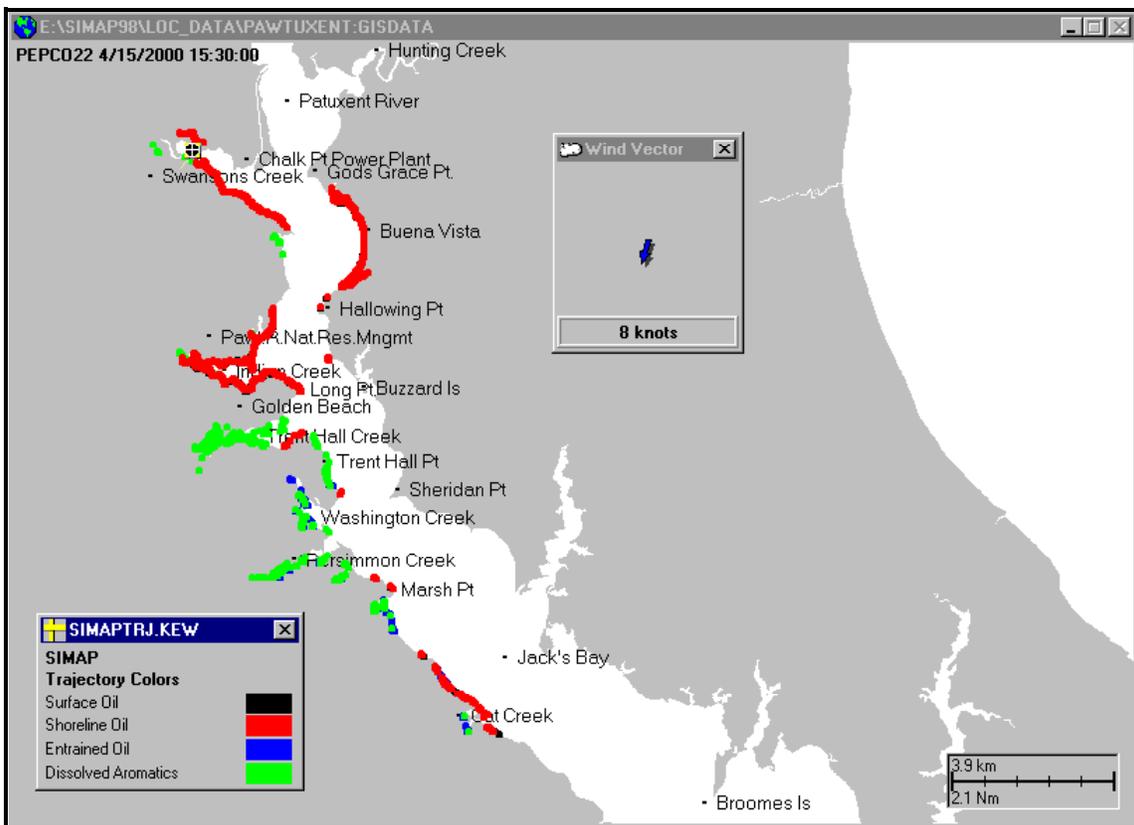

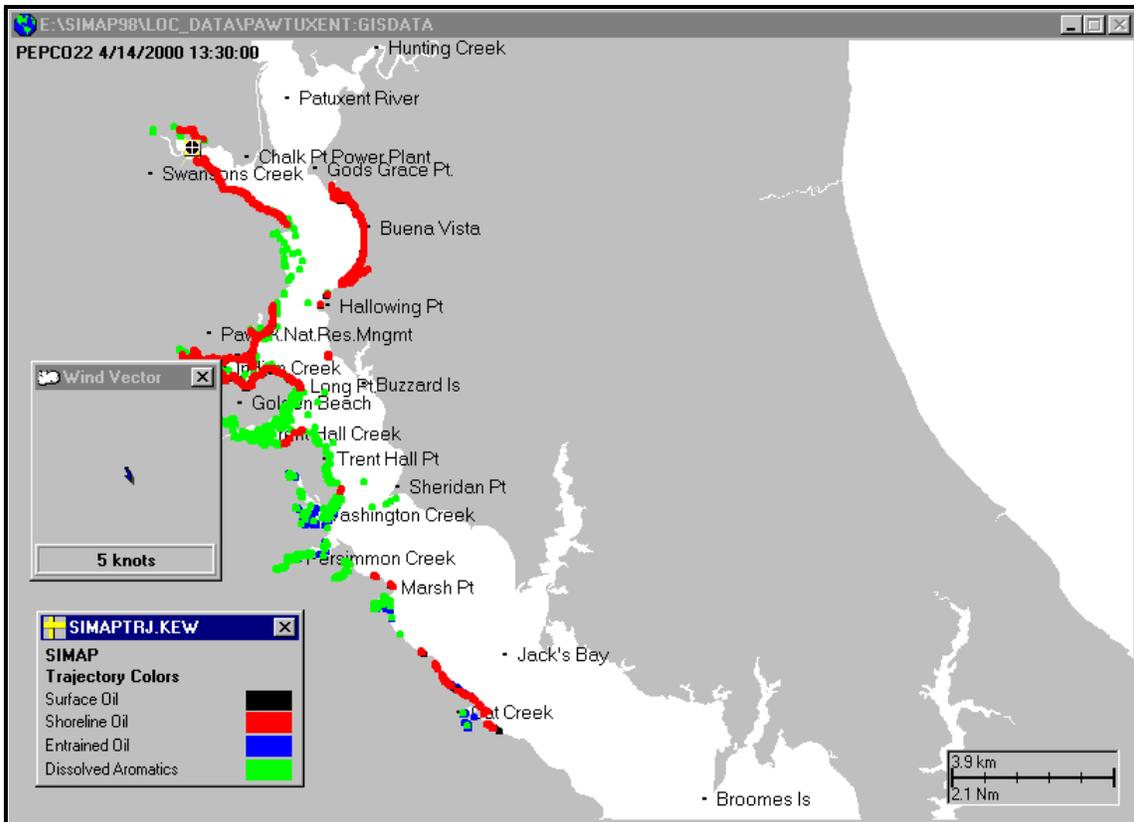

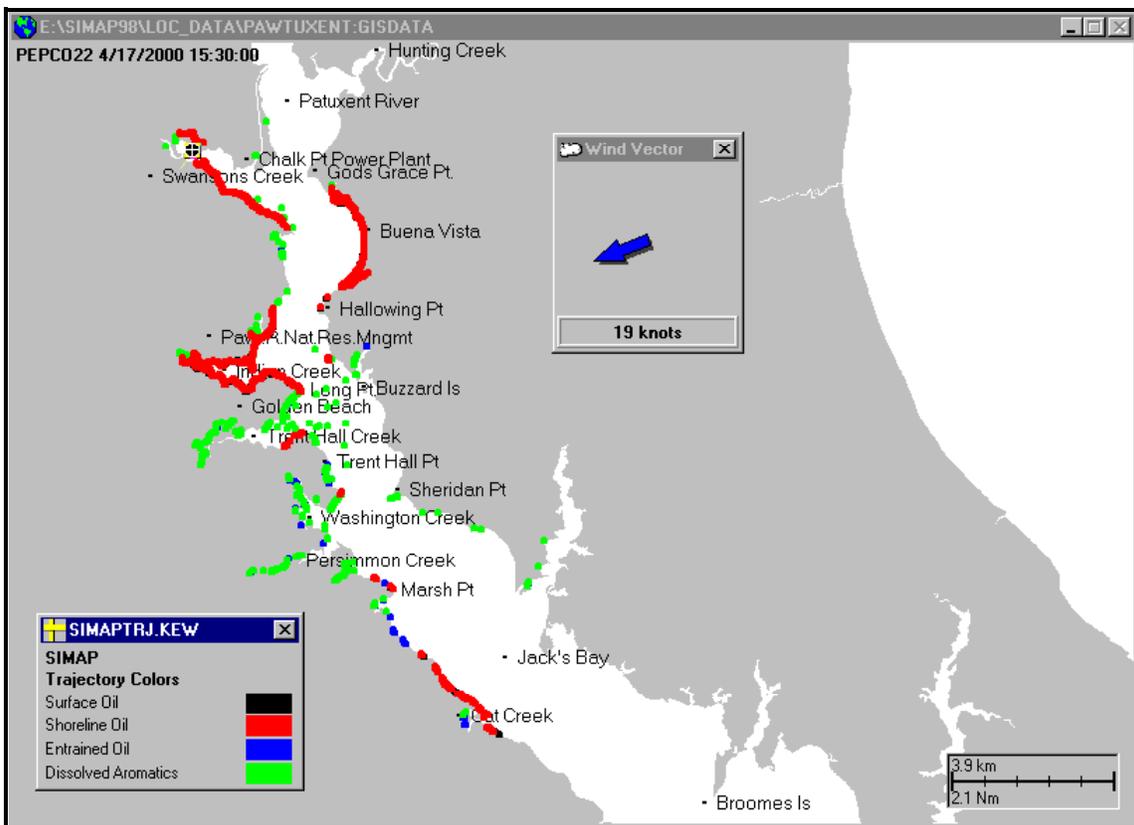

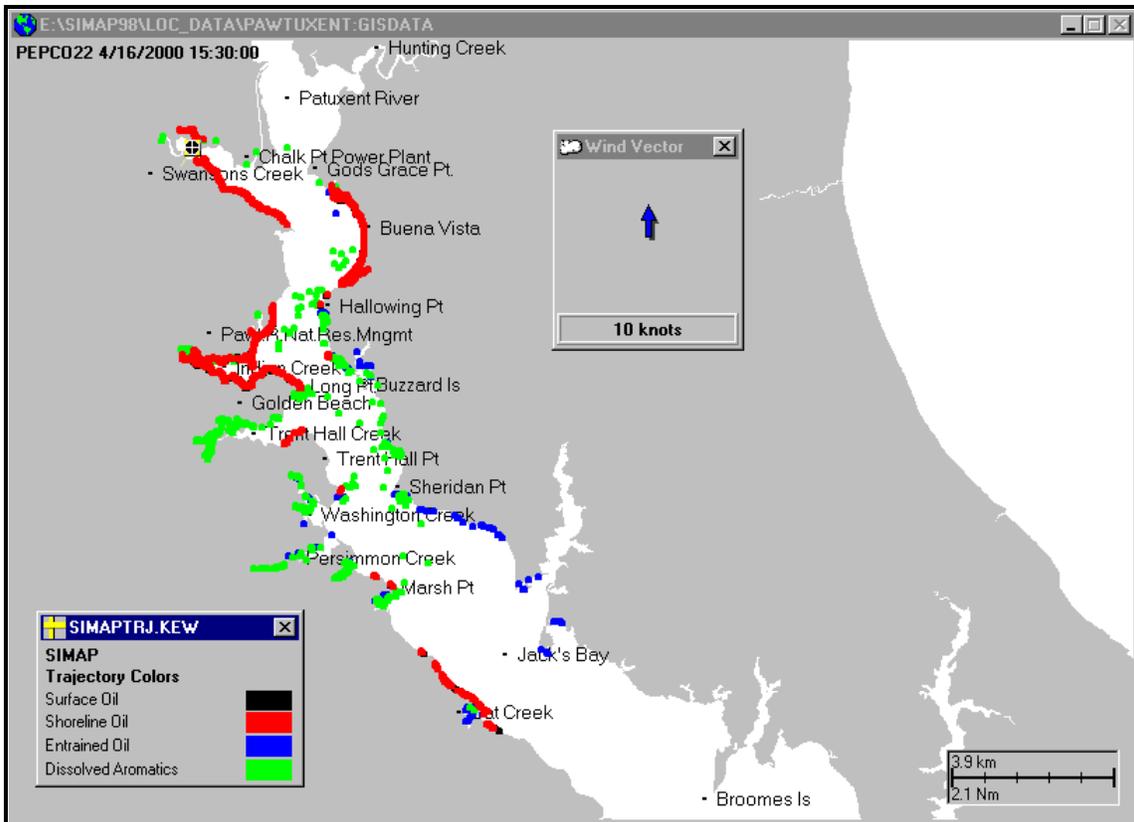

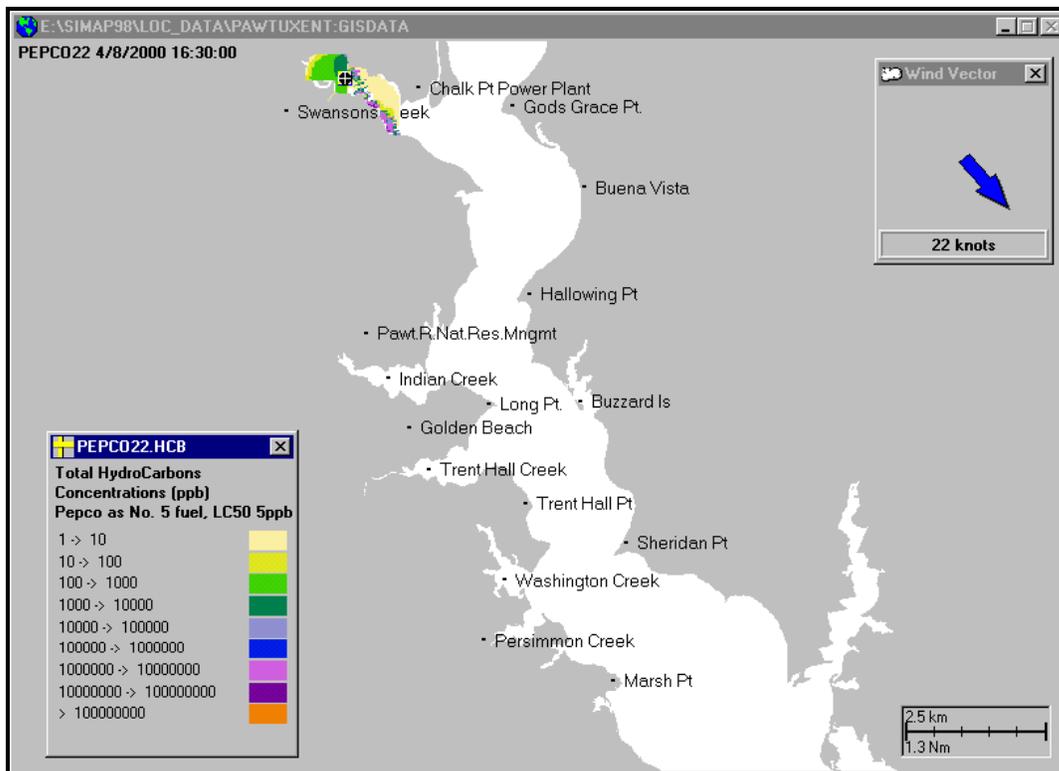

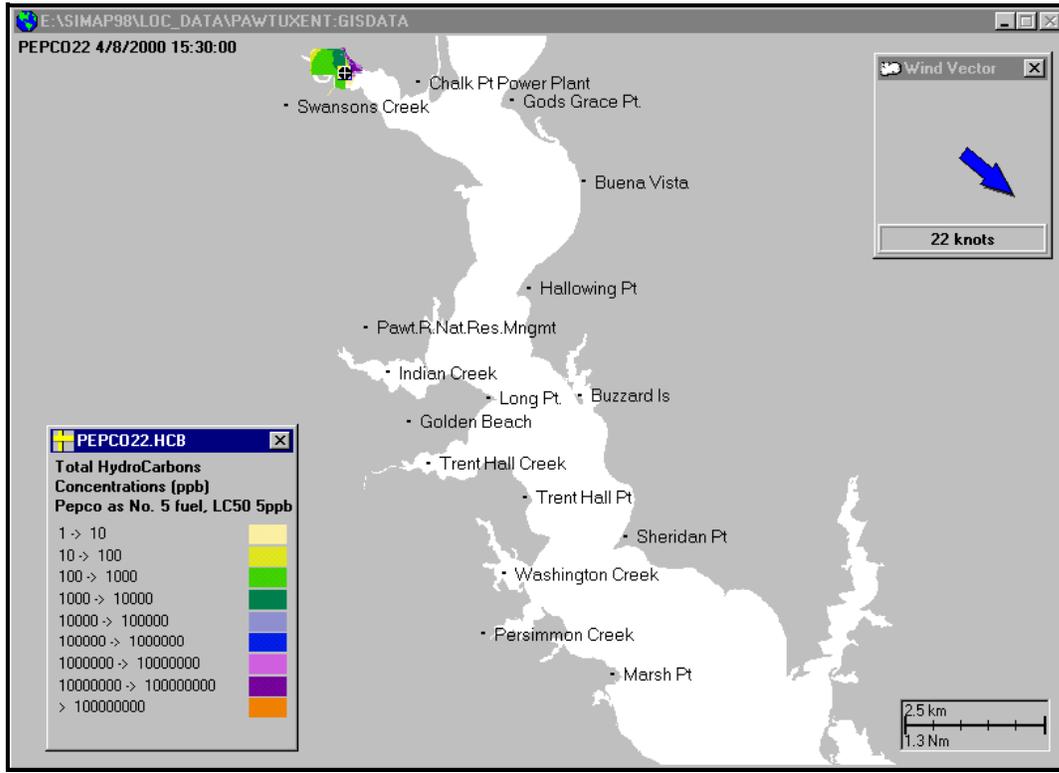

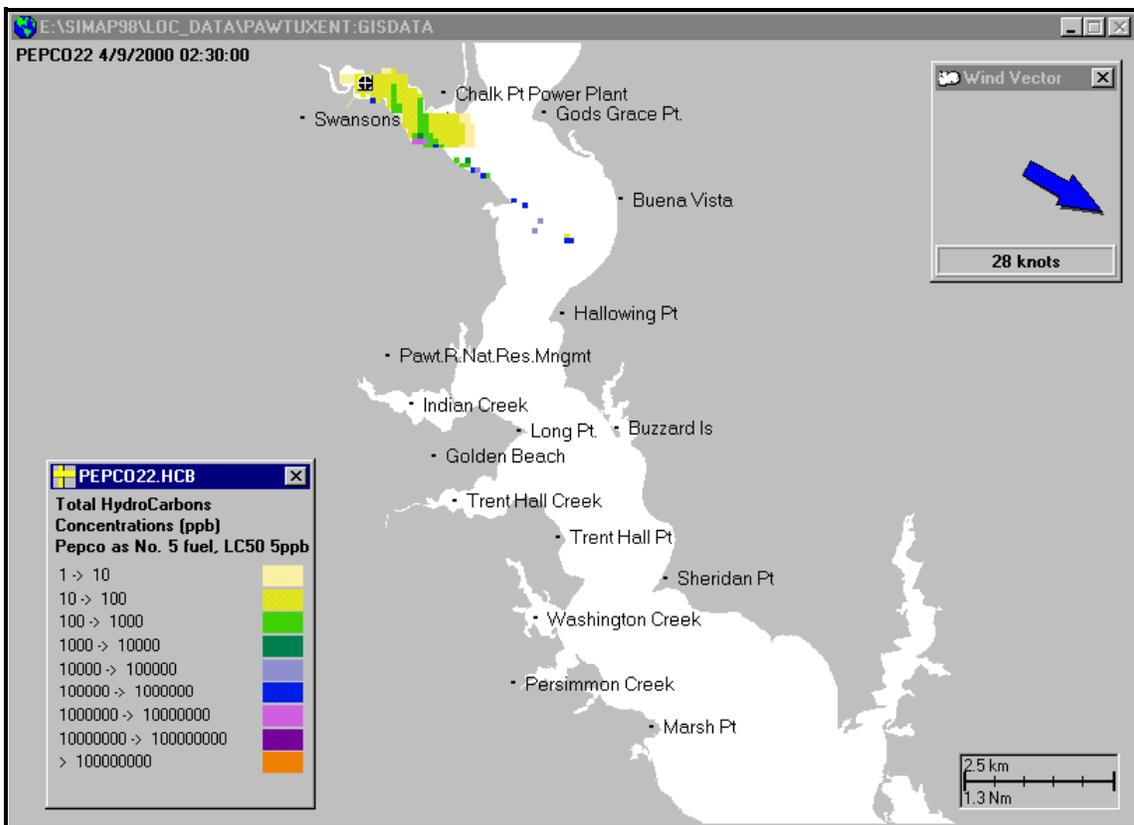

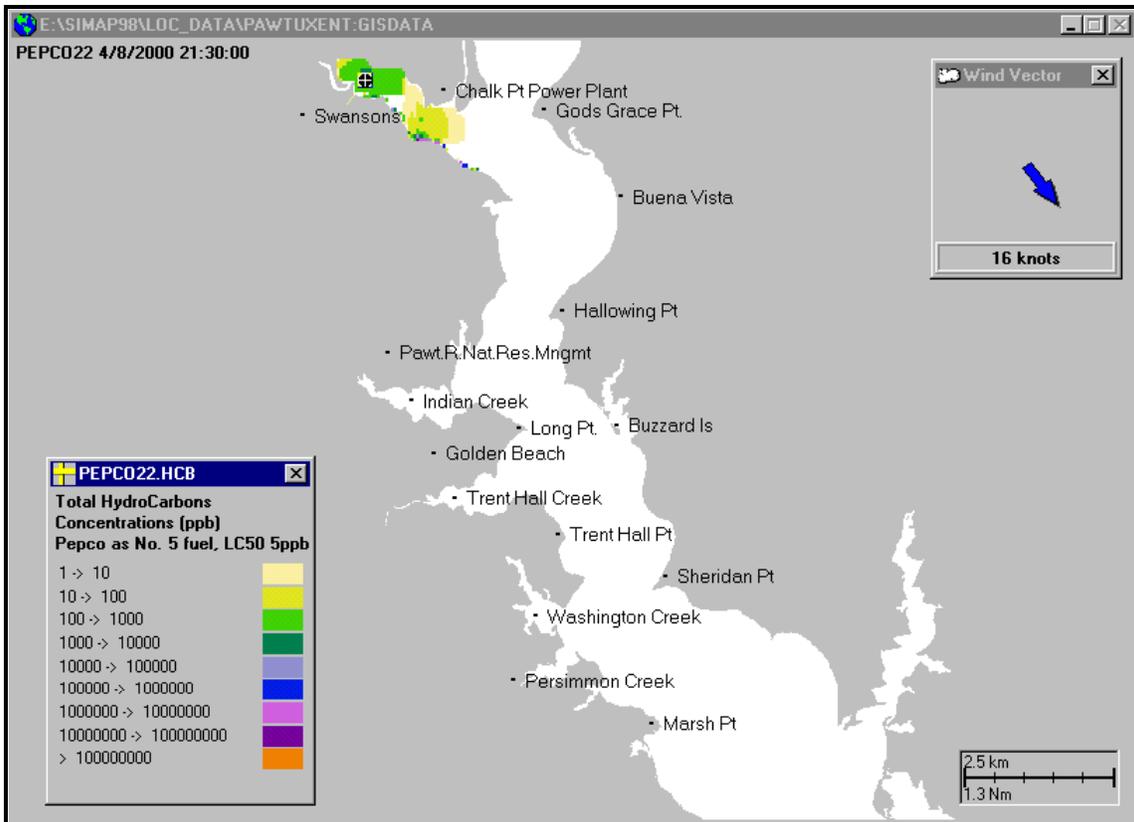

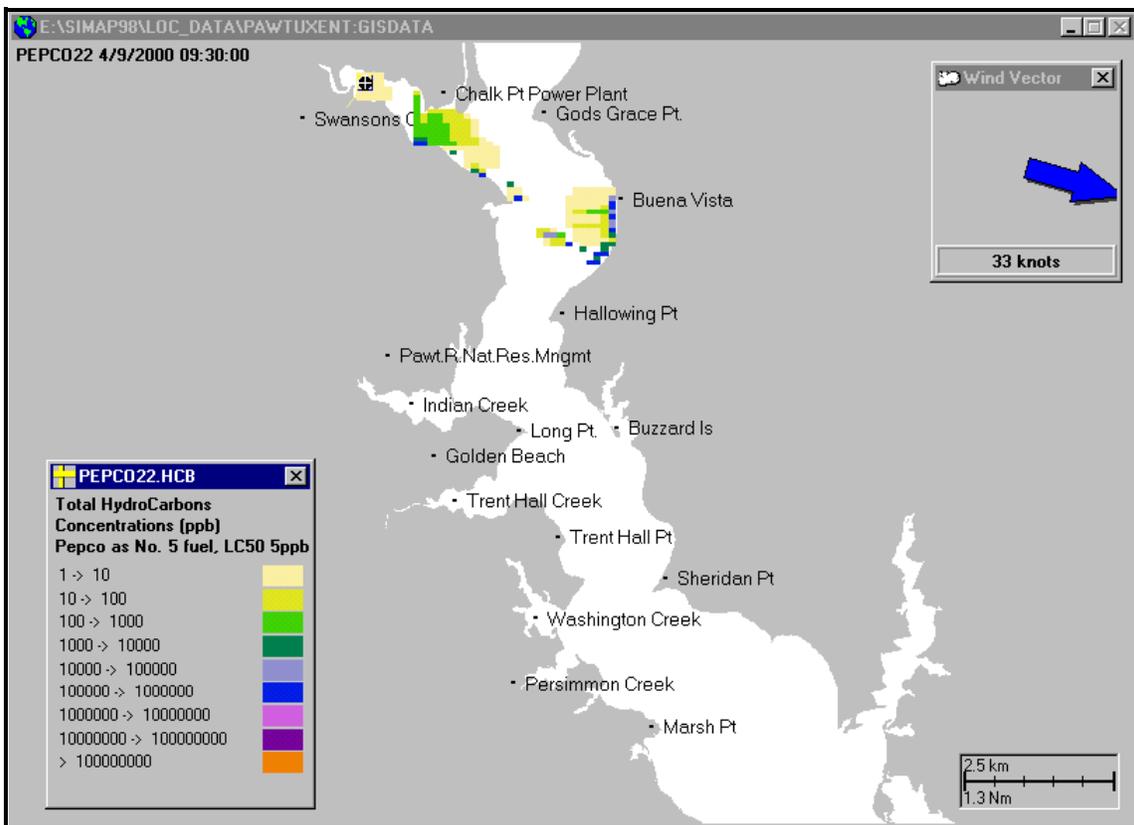

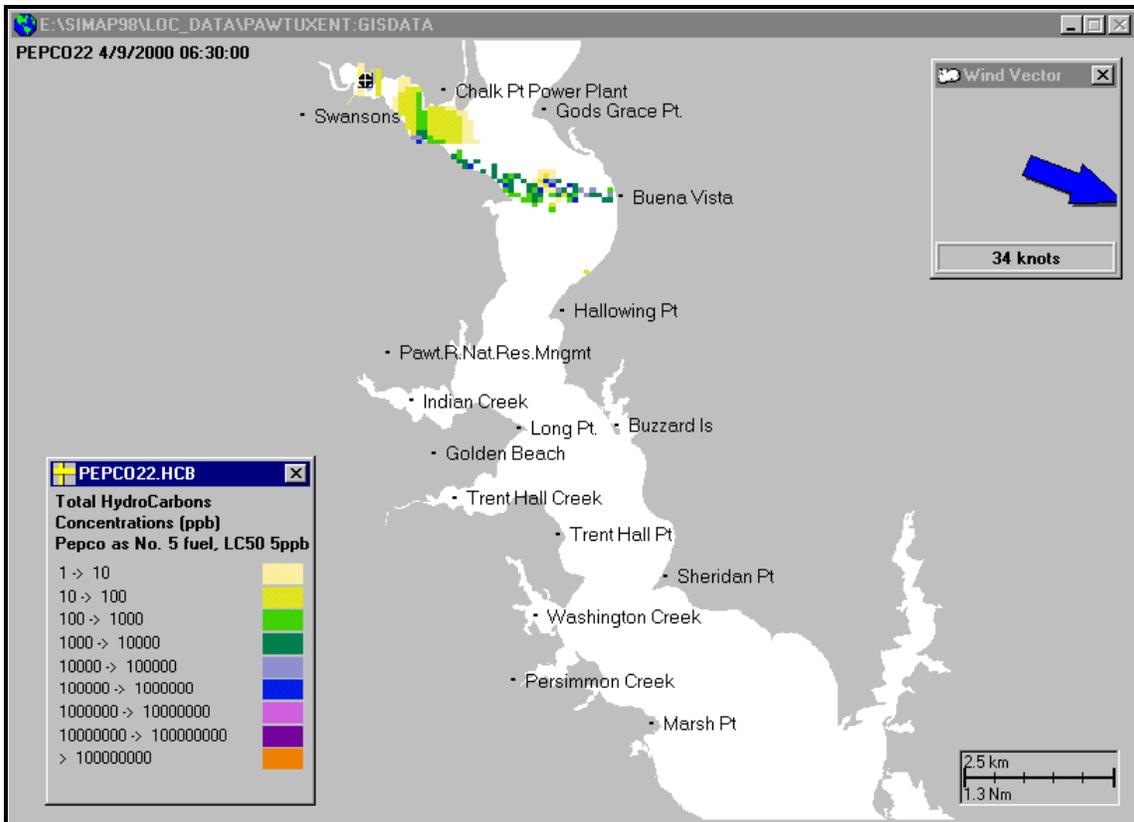

Appendix G. Modeled Total Hydrocarbon Concentrations over Time

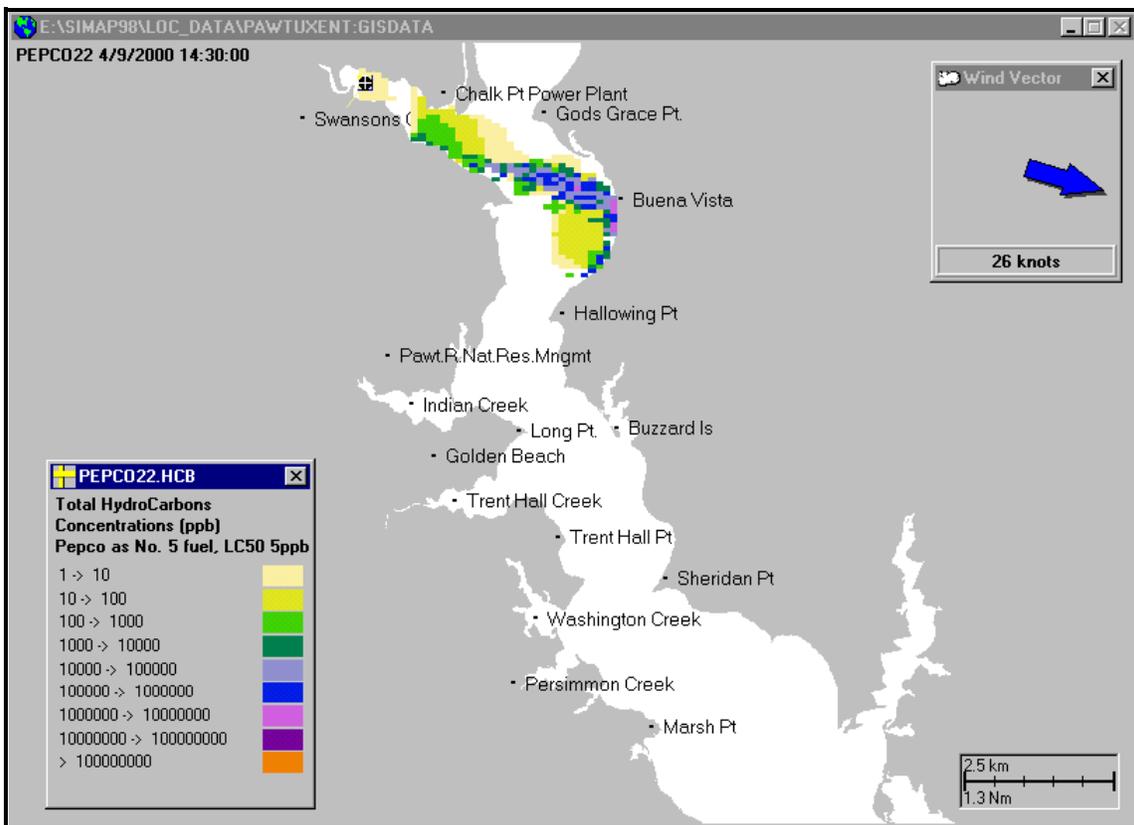

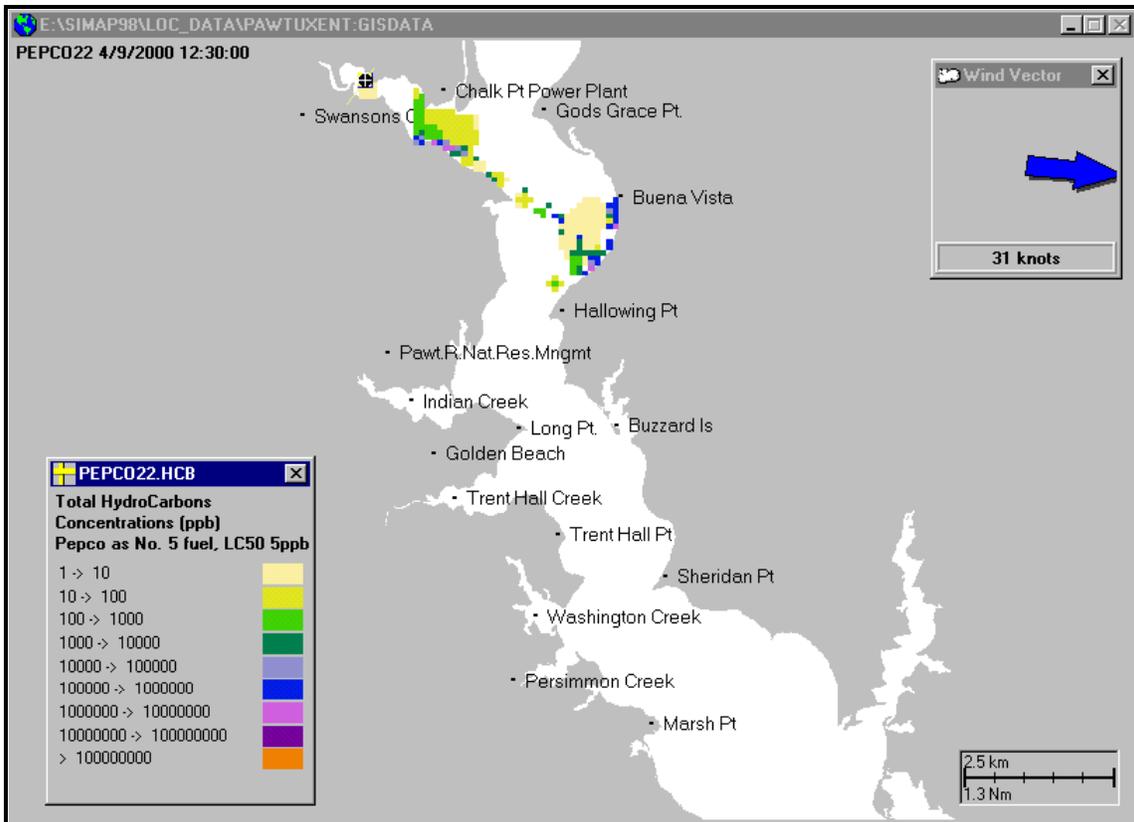

The following figures show concentrations of total hydrocarbons on and in the water after the spill. Concentrations are calculated for a grid (50 X 50 cells horizontally, 5 layers vertically) sized to just cover the plume at the time of the output. The surface layer of that grid contains the surface slicks and entrained oil immediately under the slick (near the water surface). The planar view shows vertical maximum concentration. Shoreline oiling is not shown in these figures.

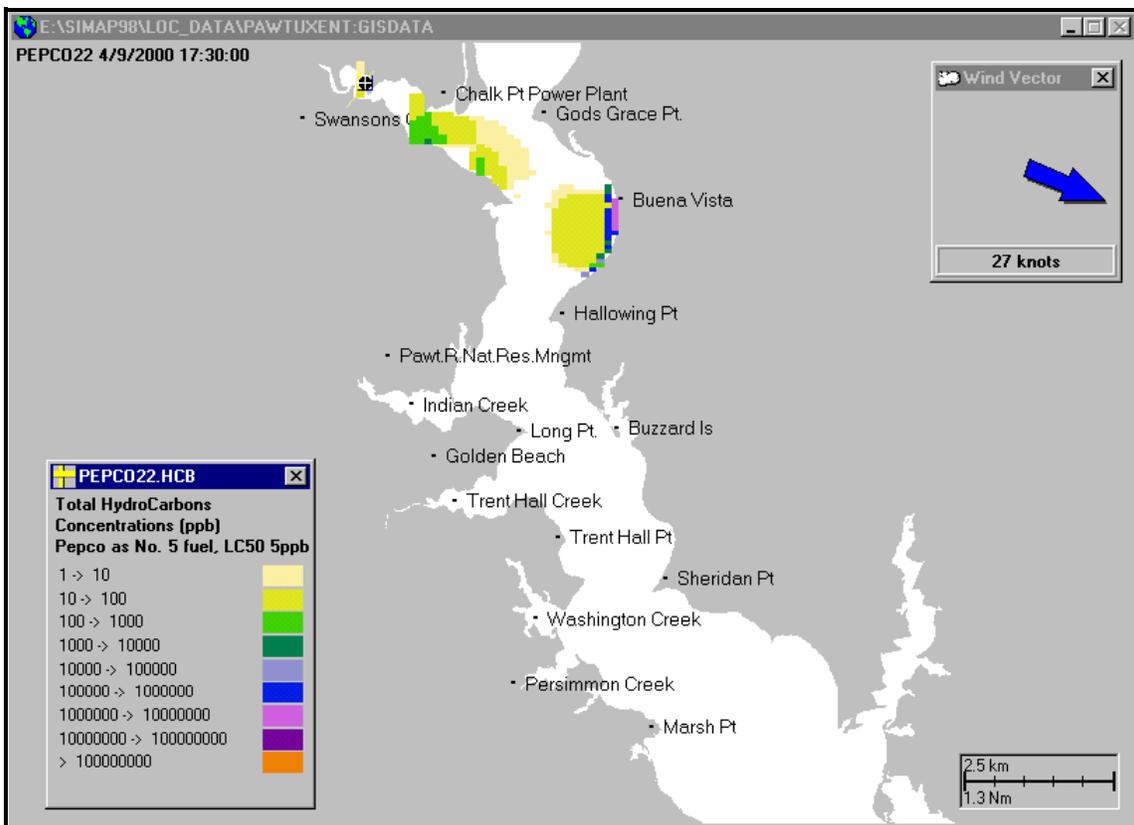

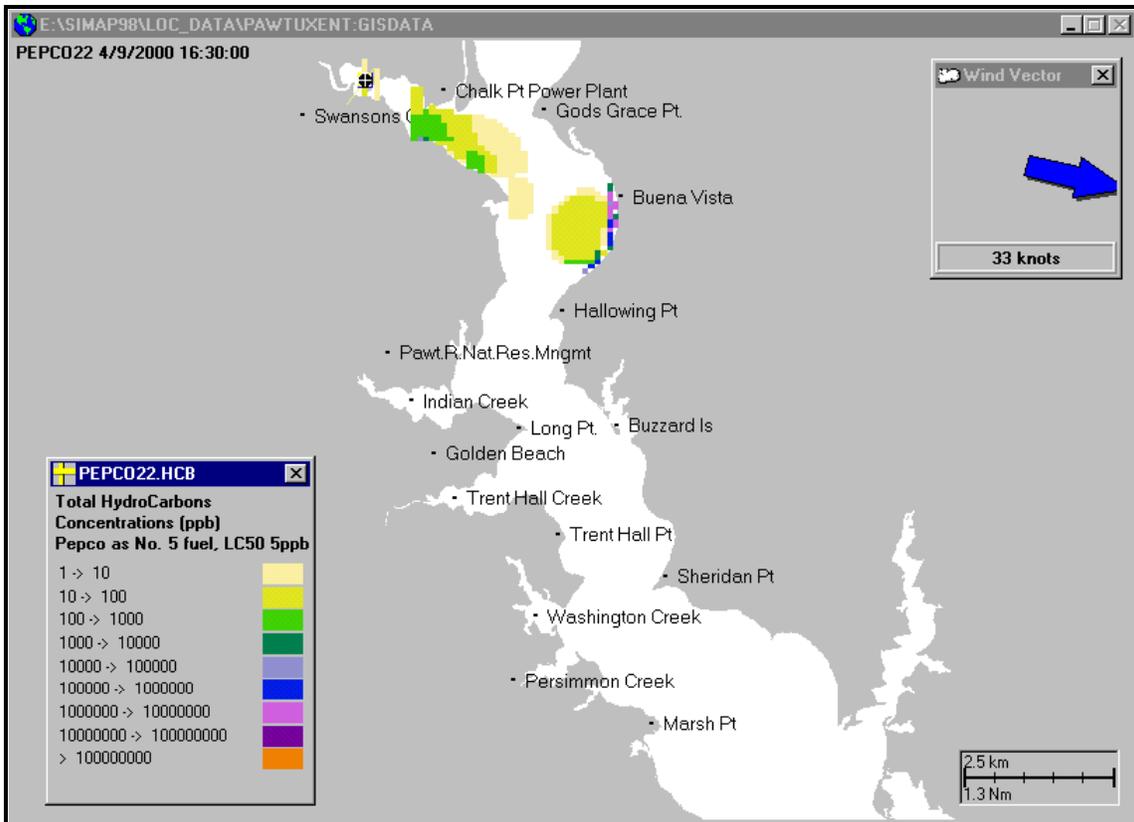

Note that the shoreline shown in these model outputs are for visual reference only, whereas the habitat (and corresponding depth) grid (Appendices B and C) defines the actual shoreline to the model.

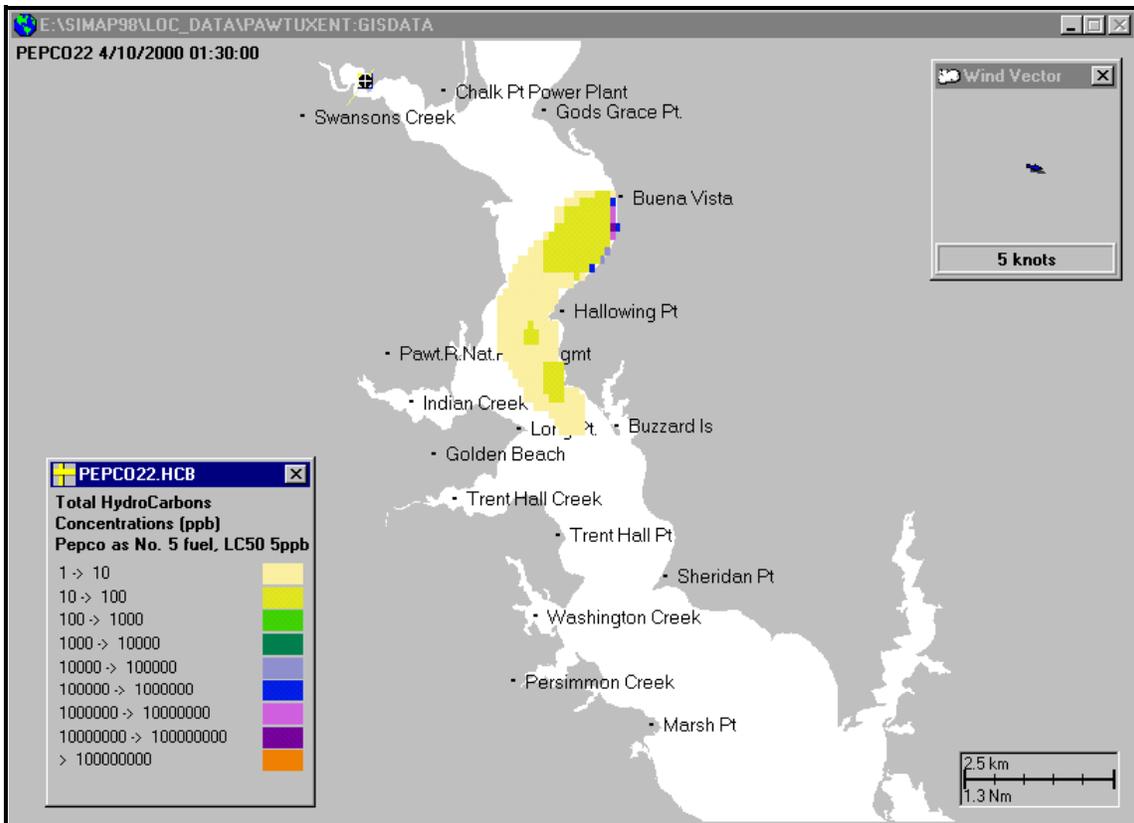

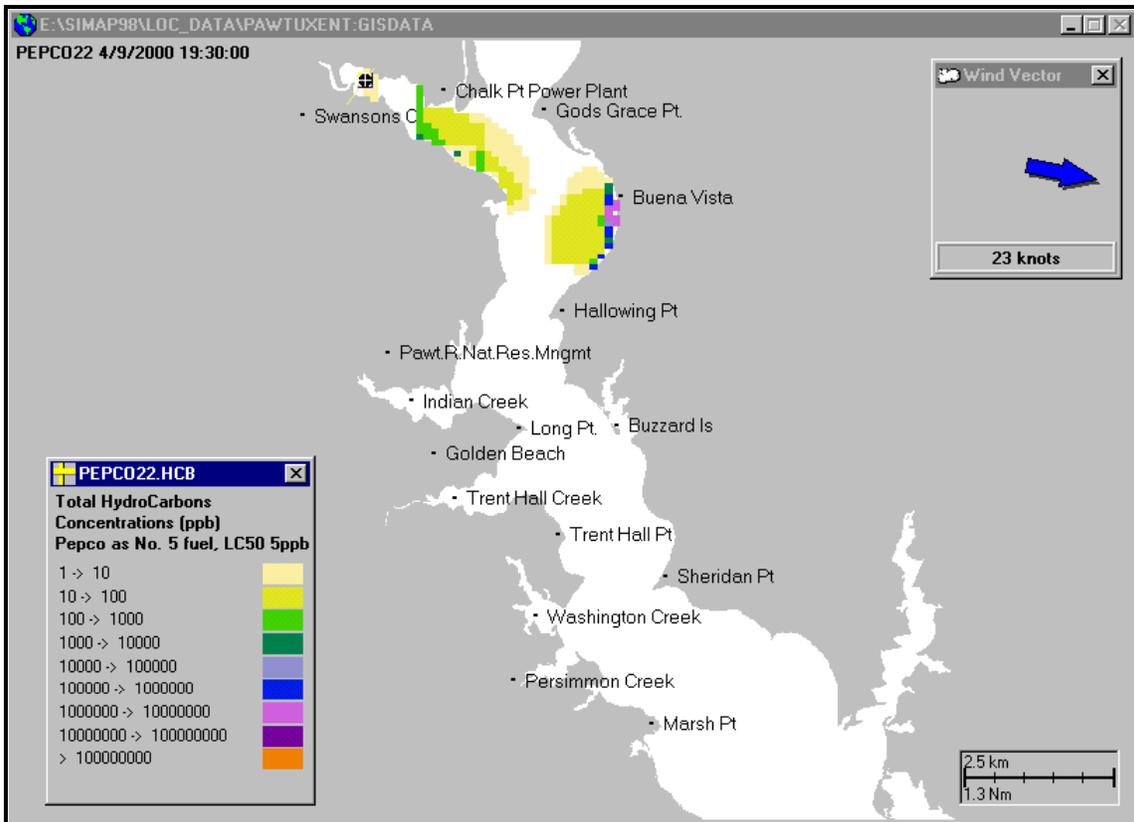

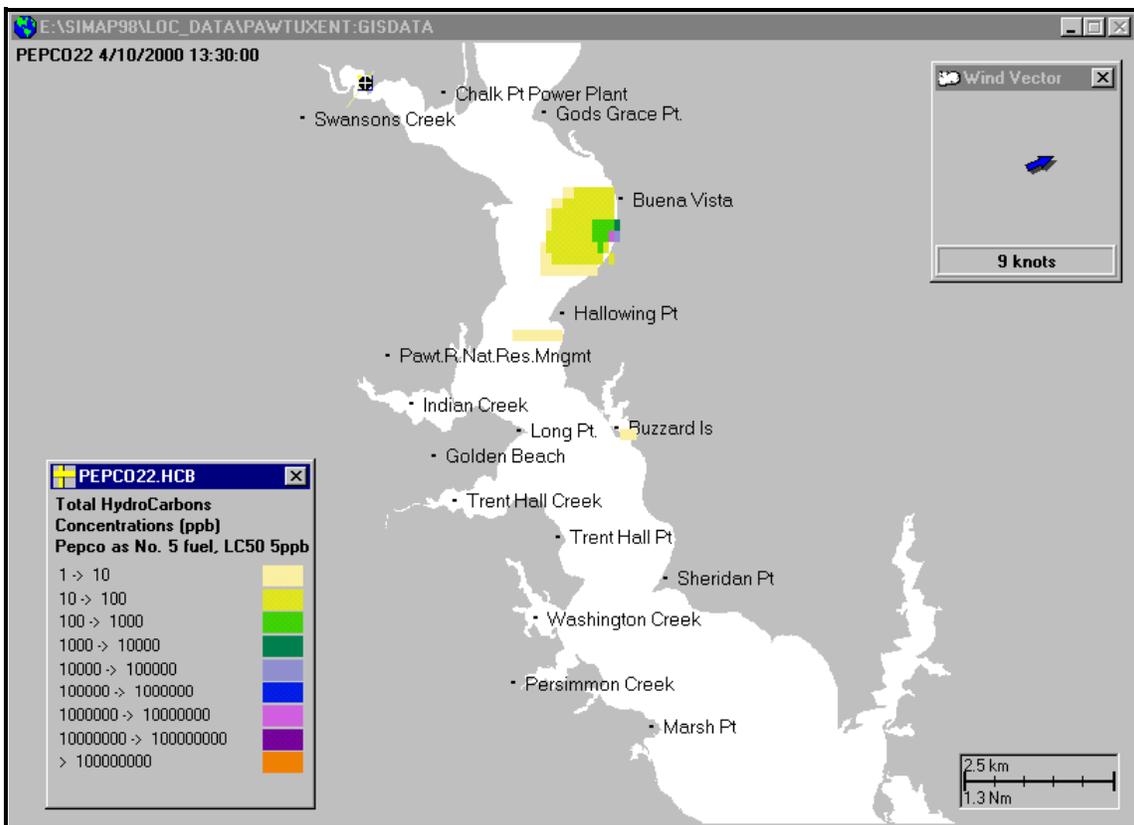

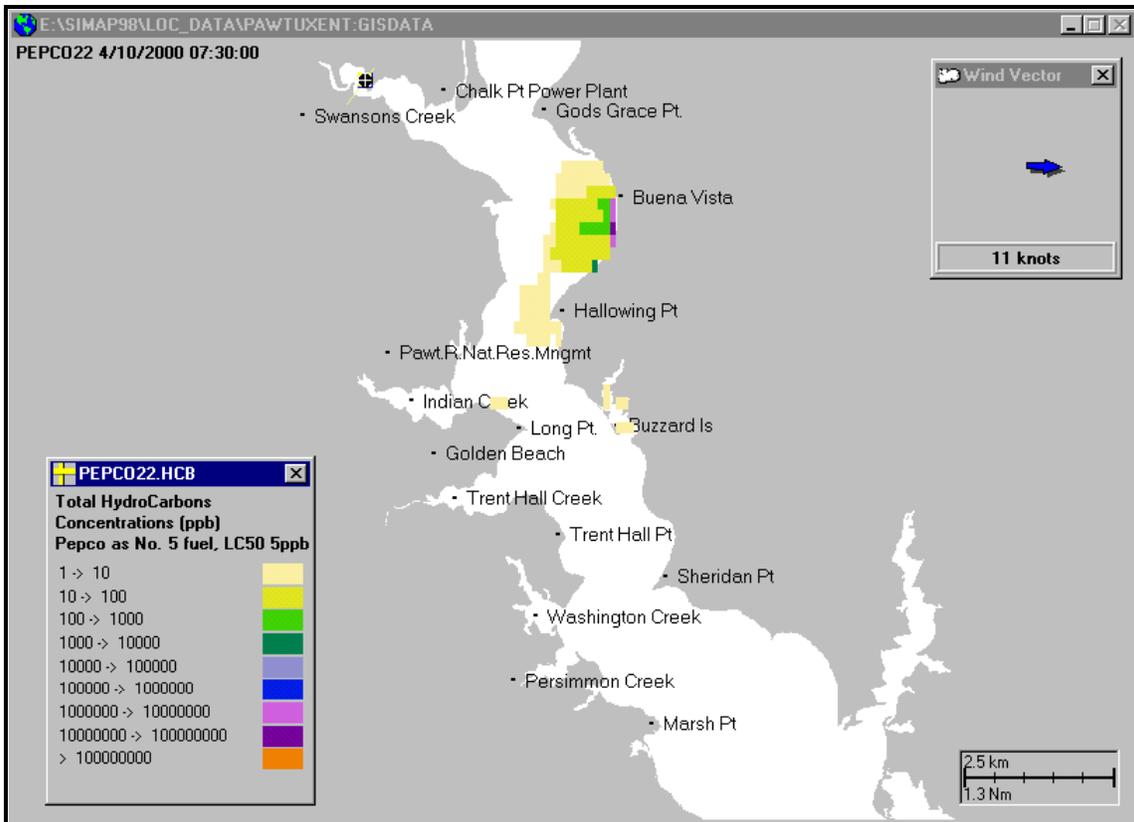

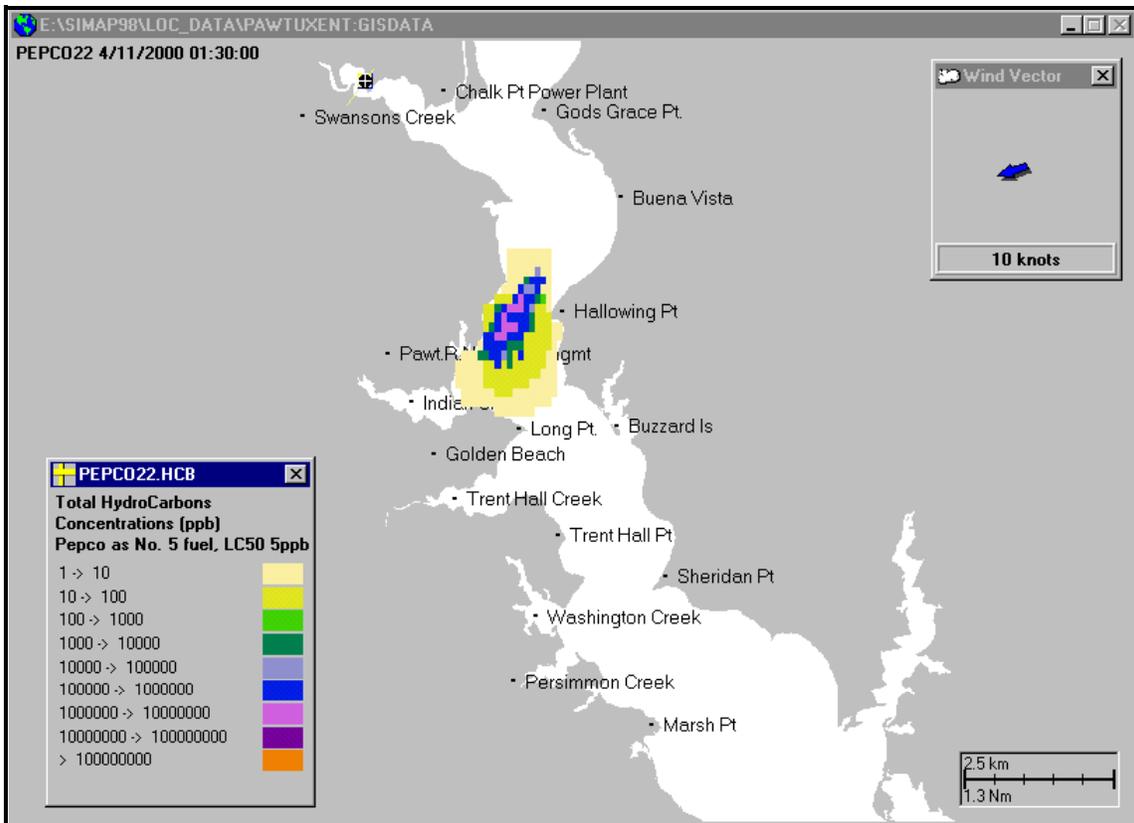

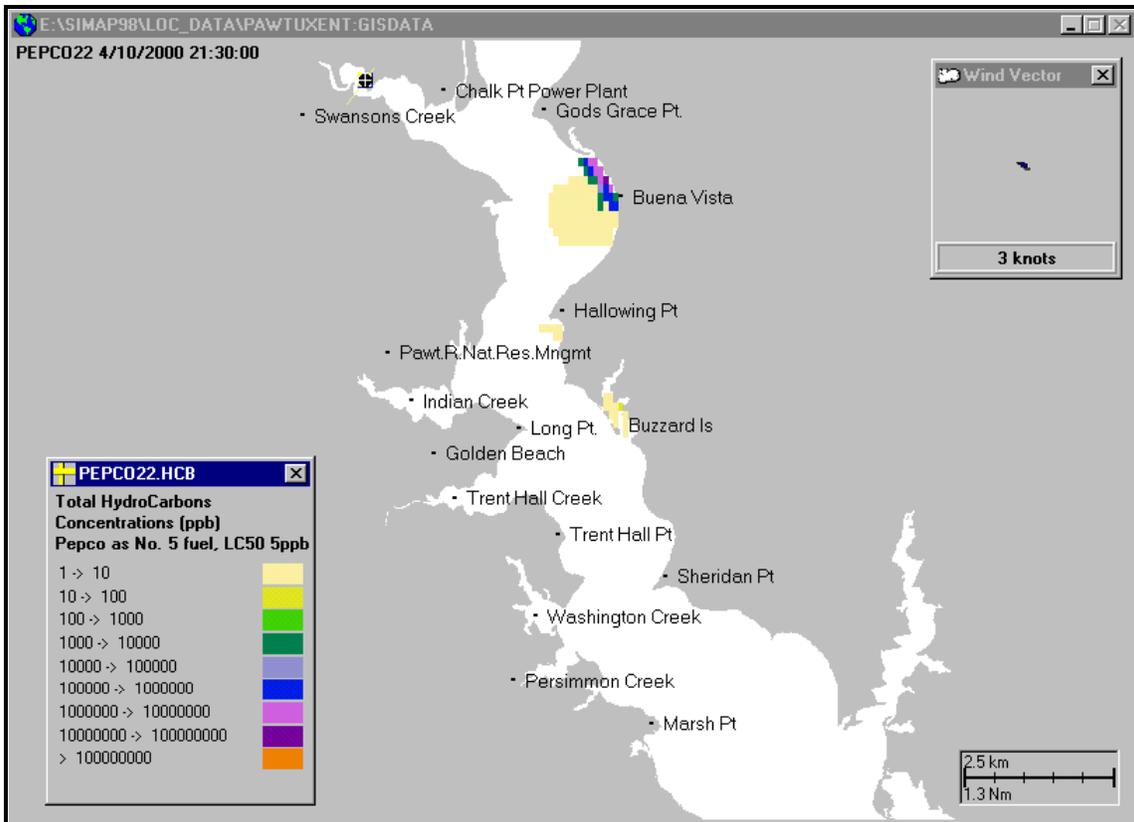

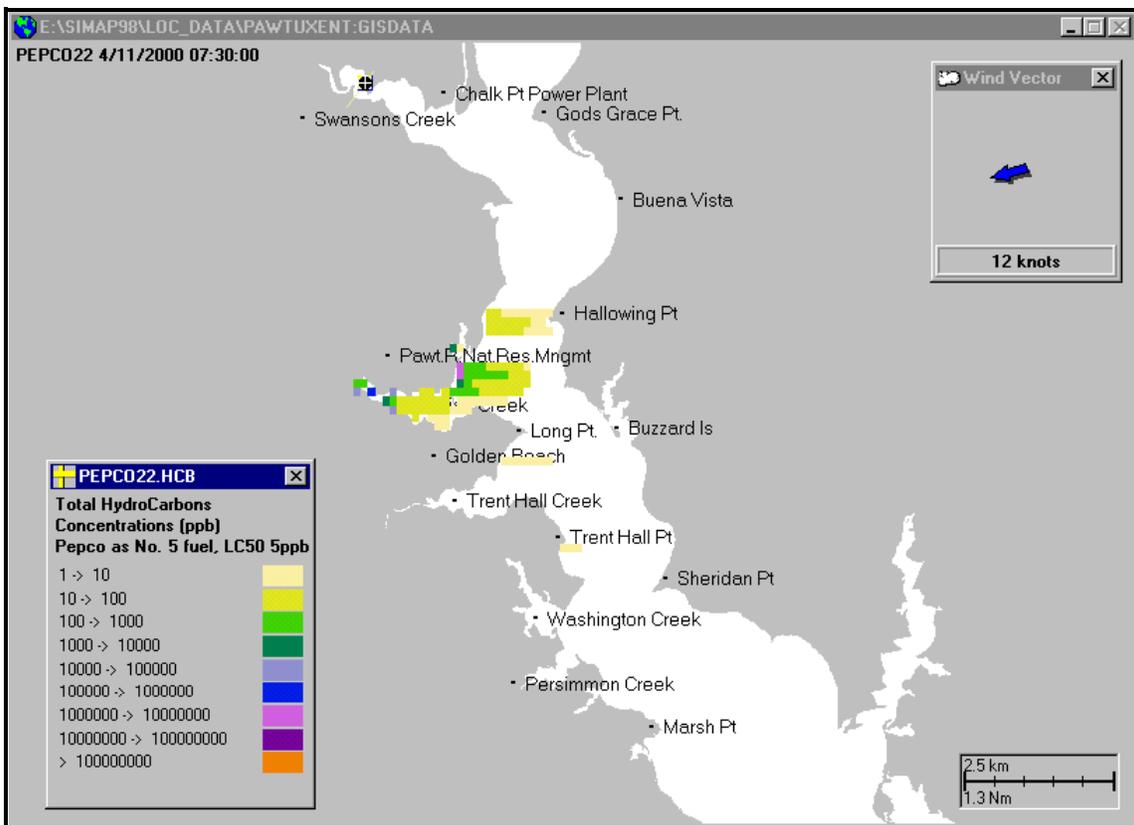

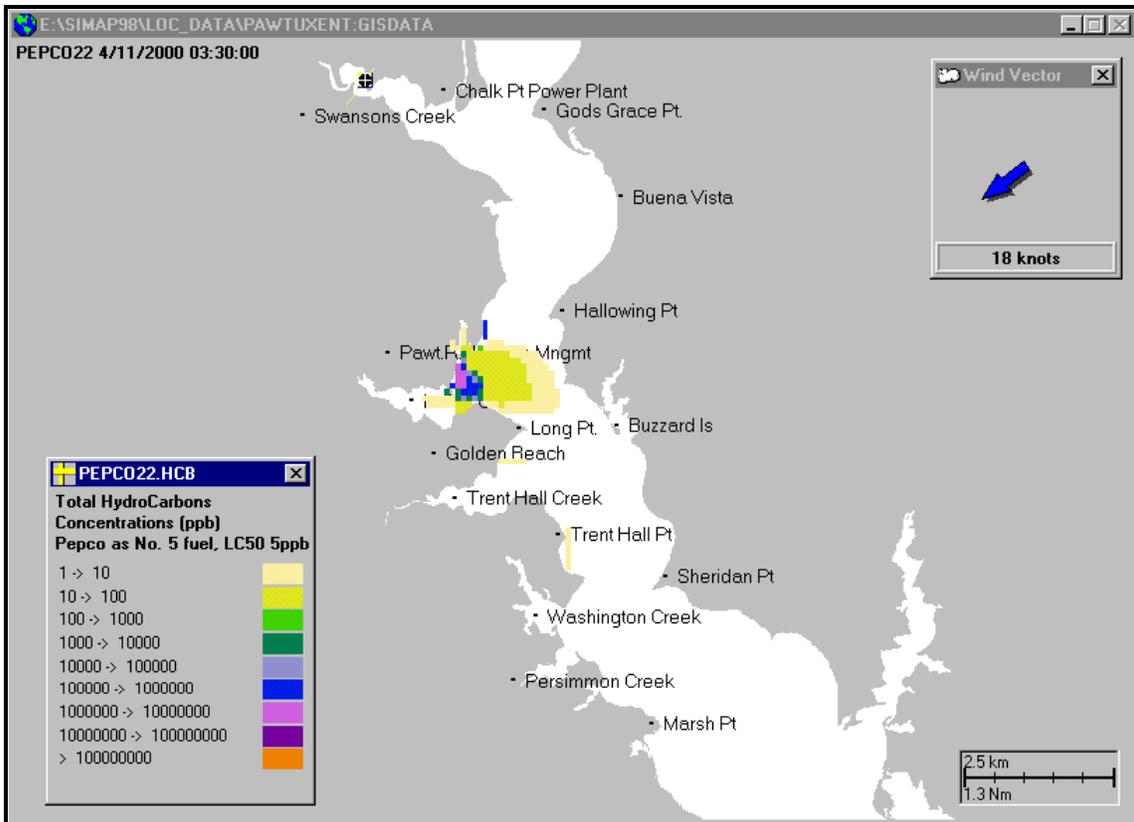

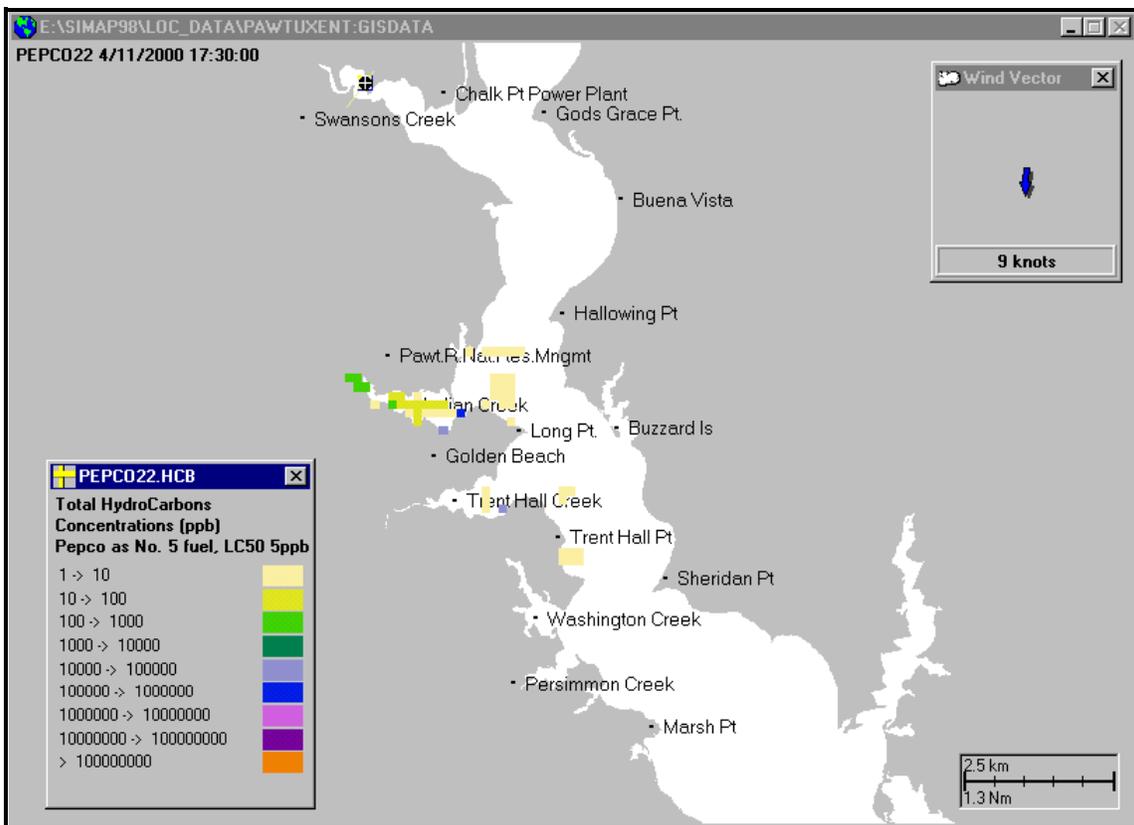

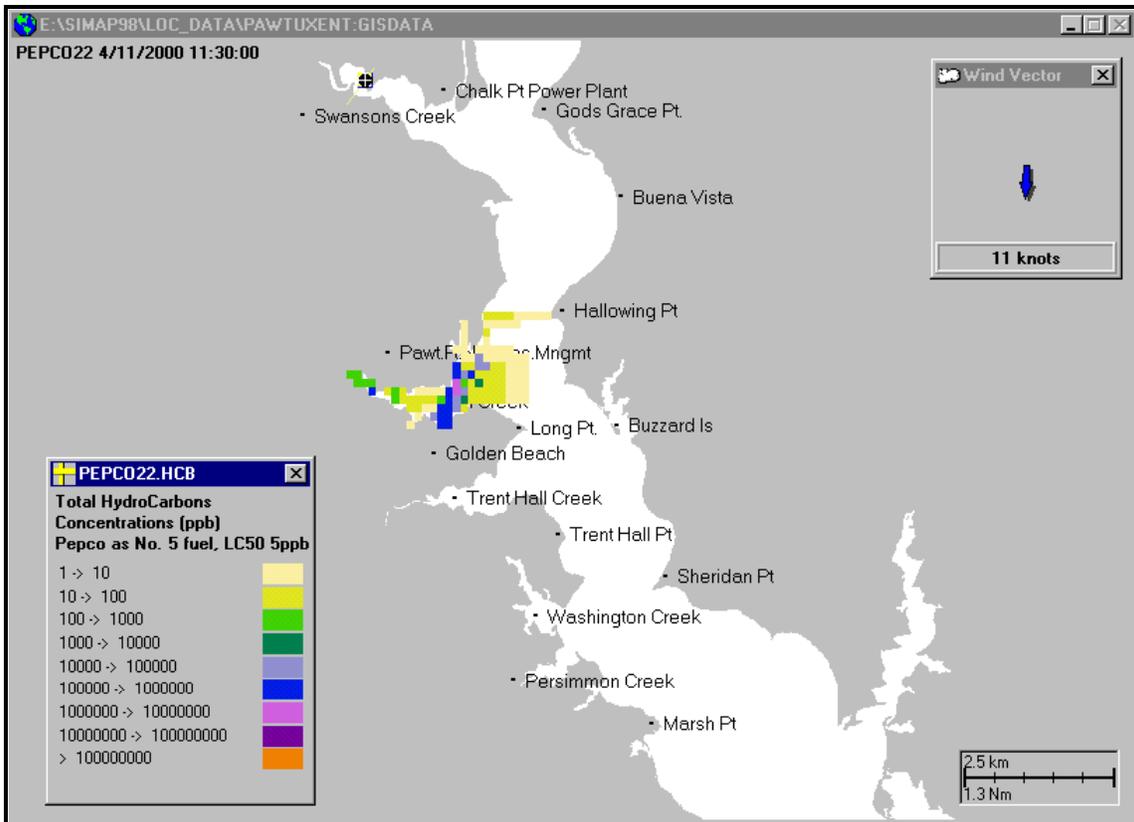

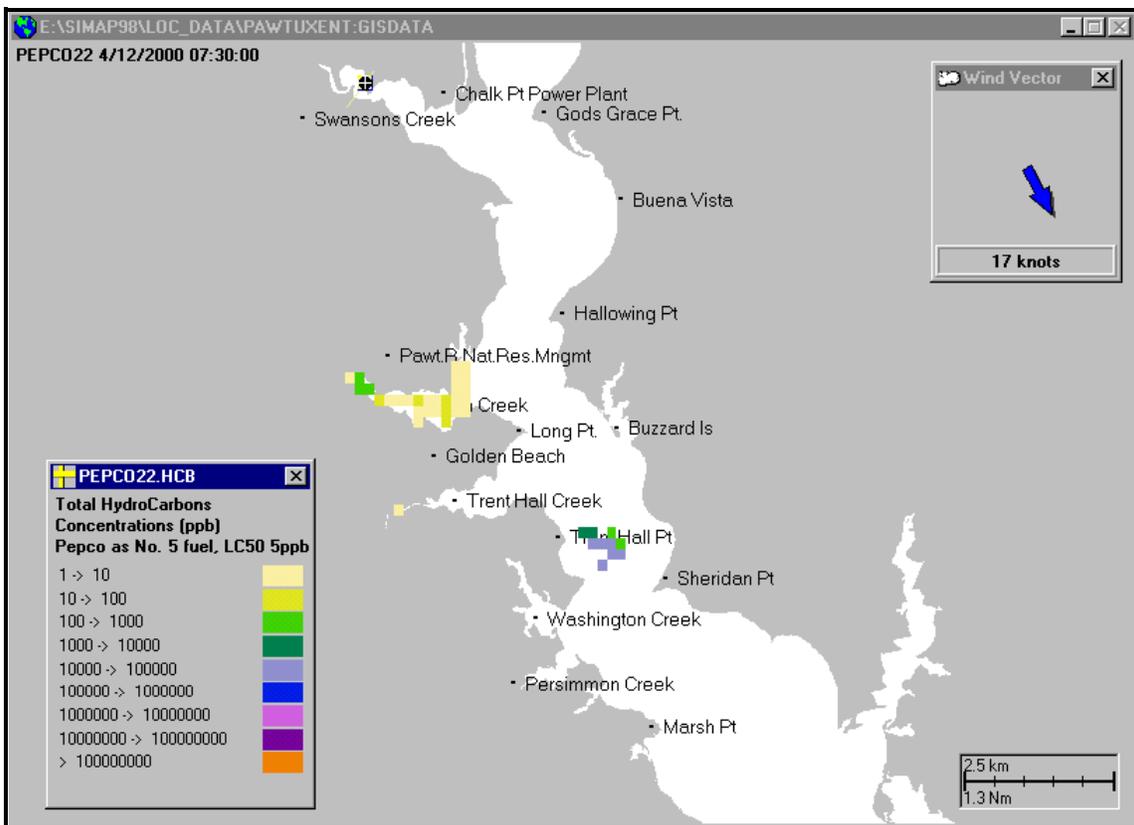

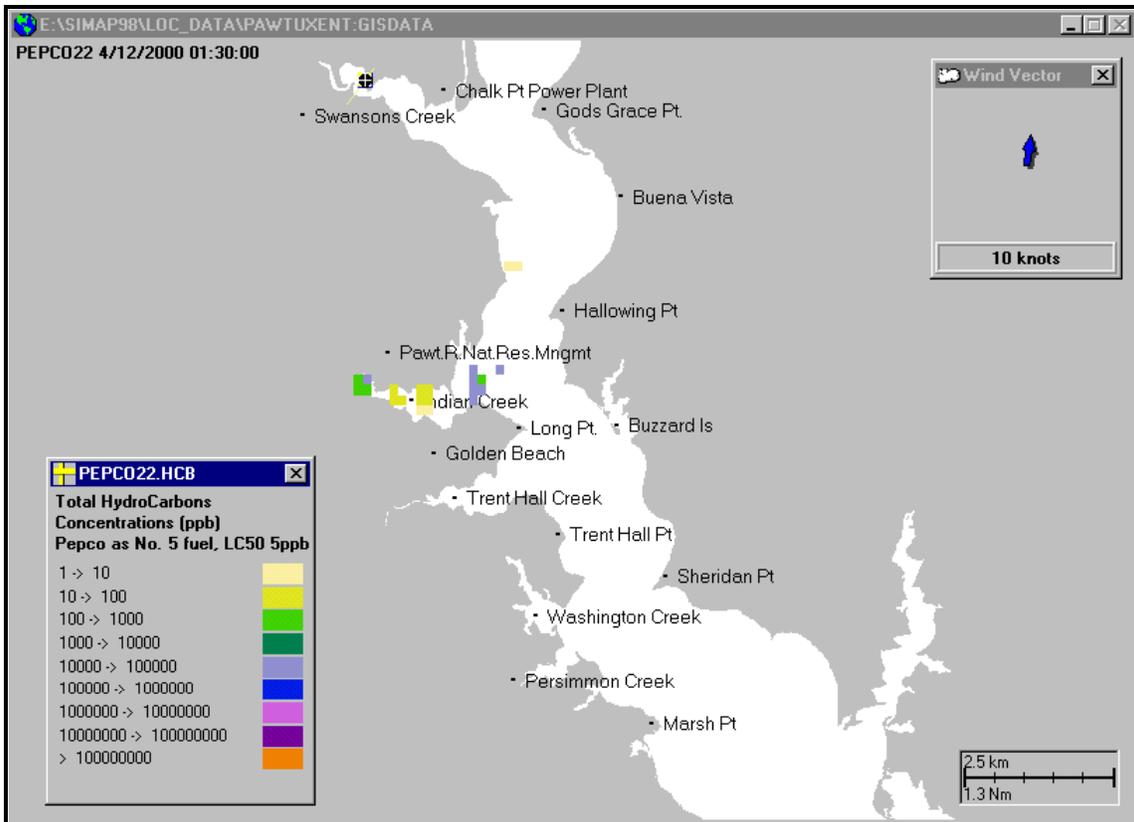

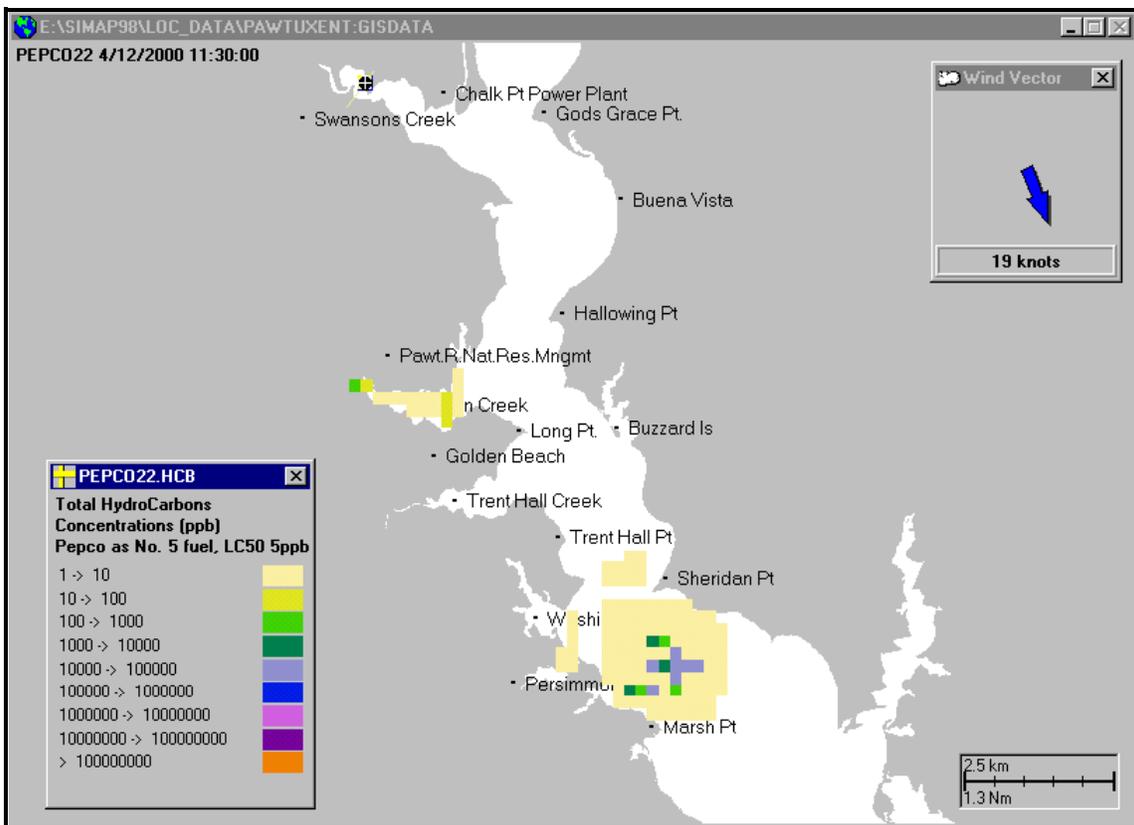

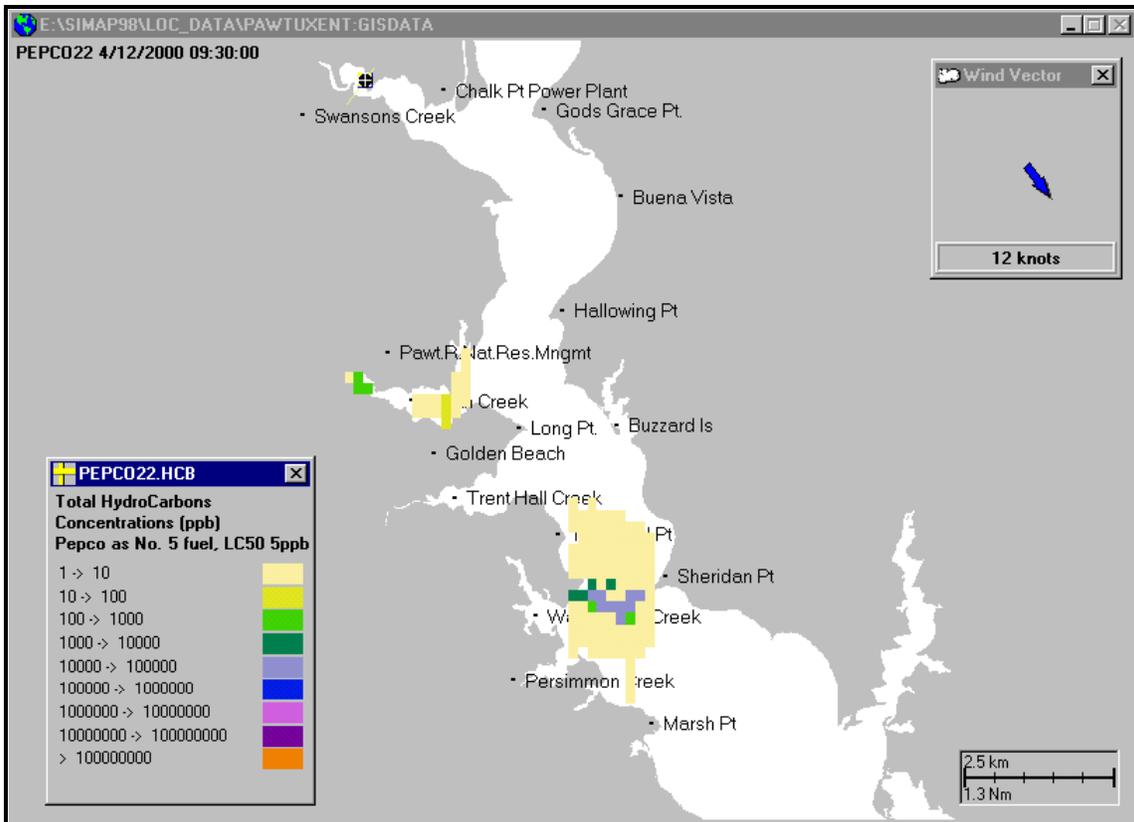

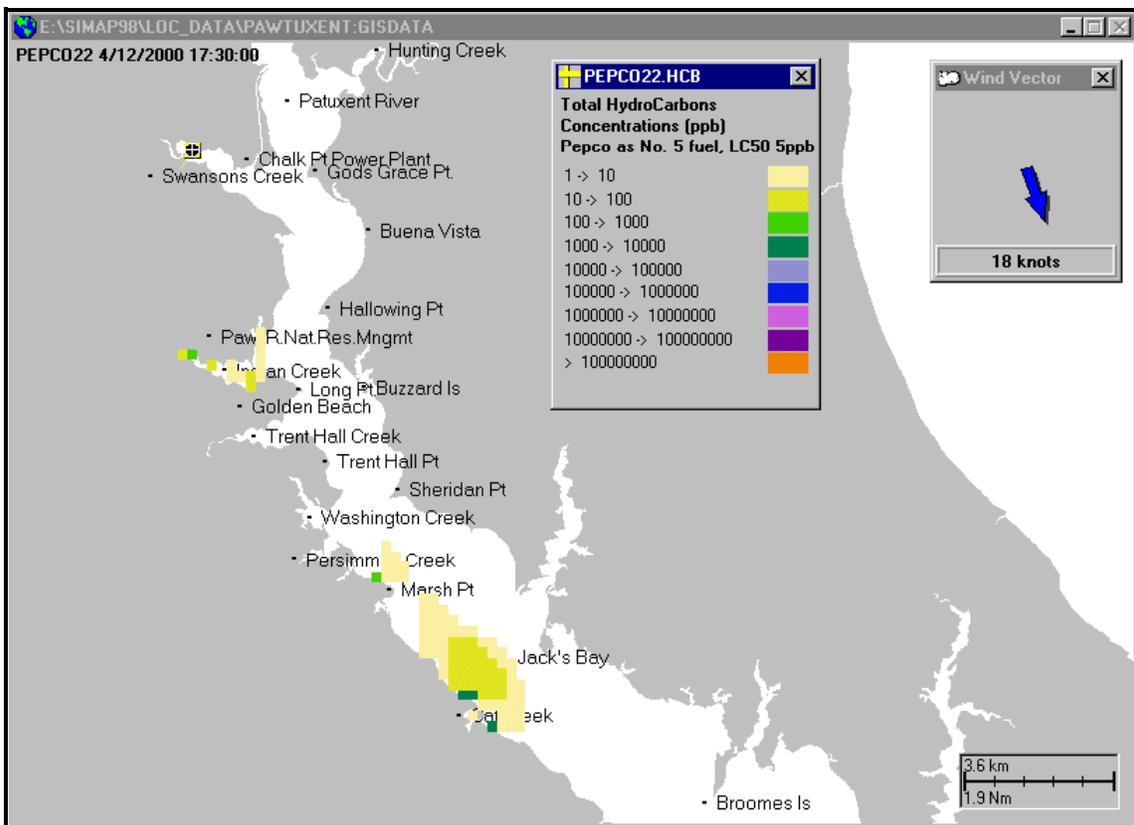

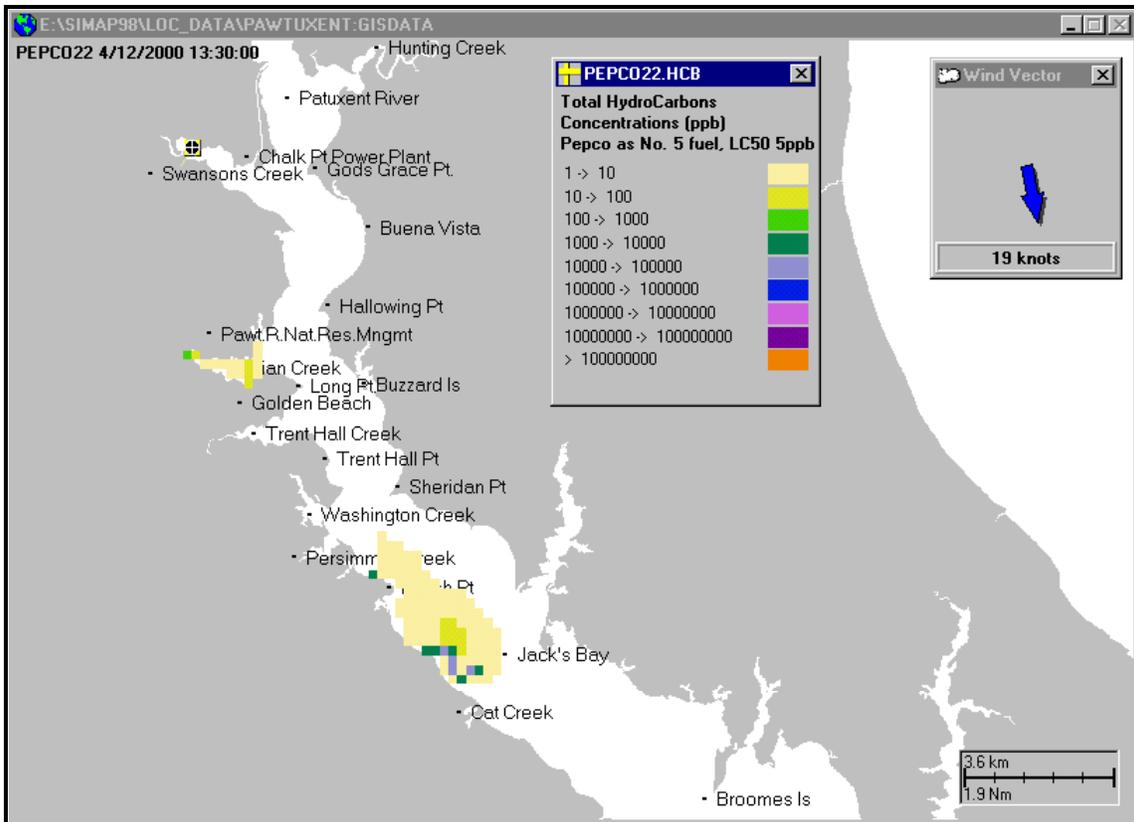

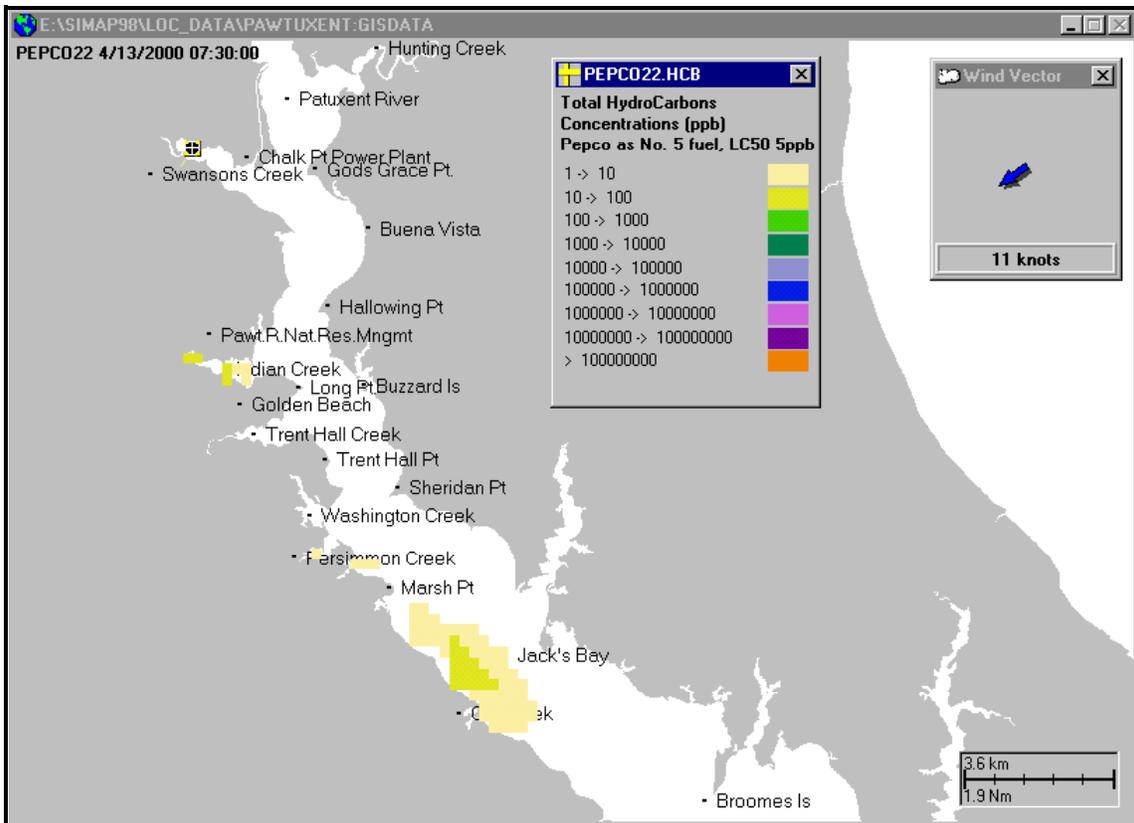

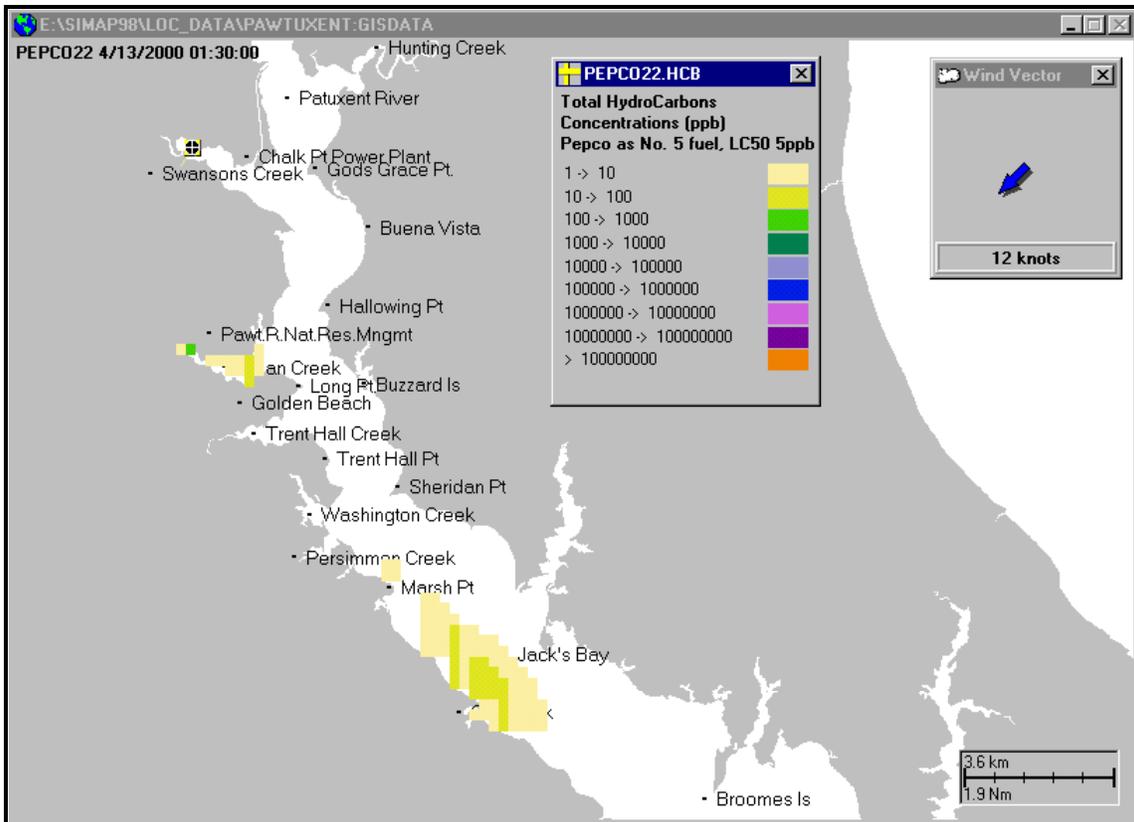

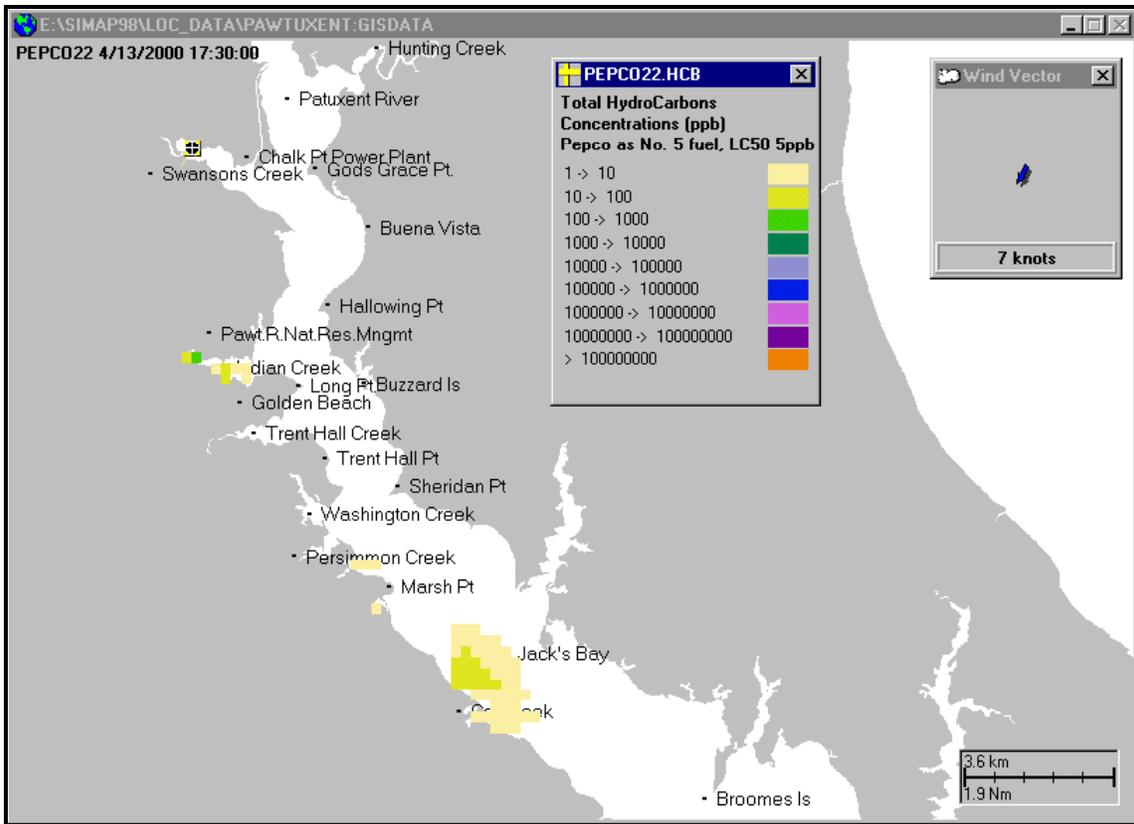

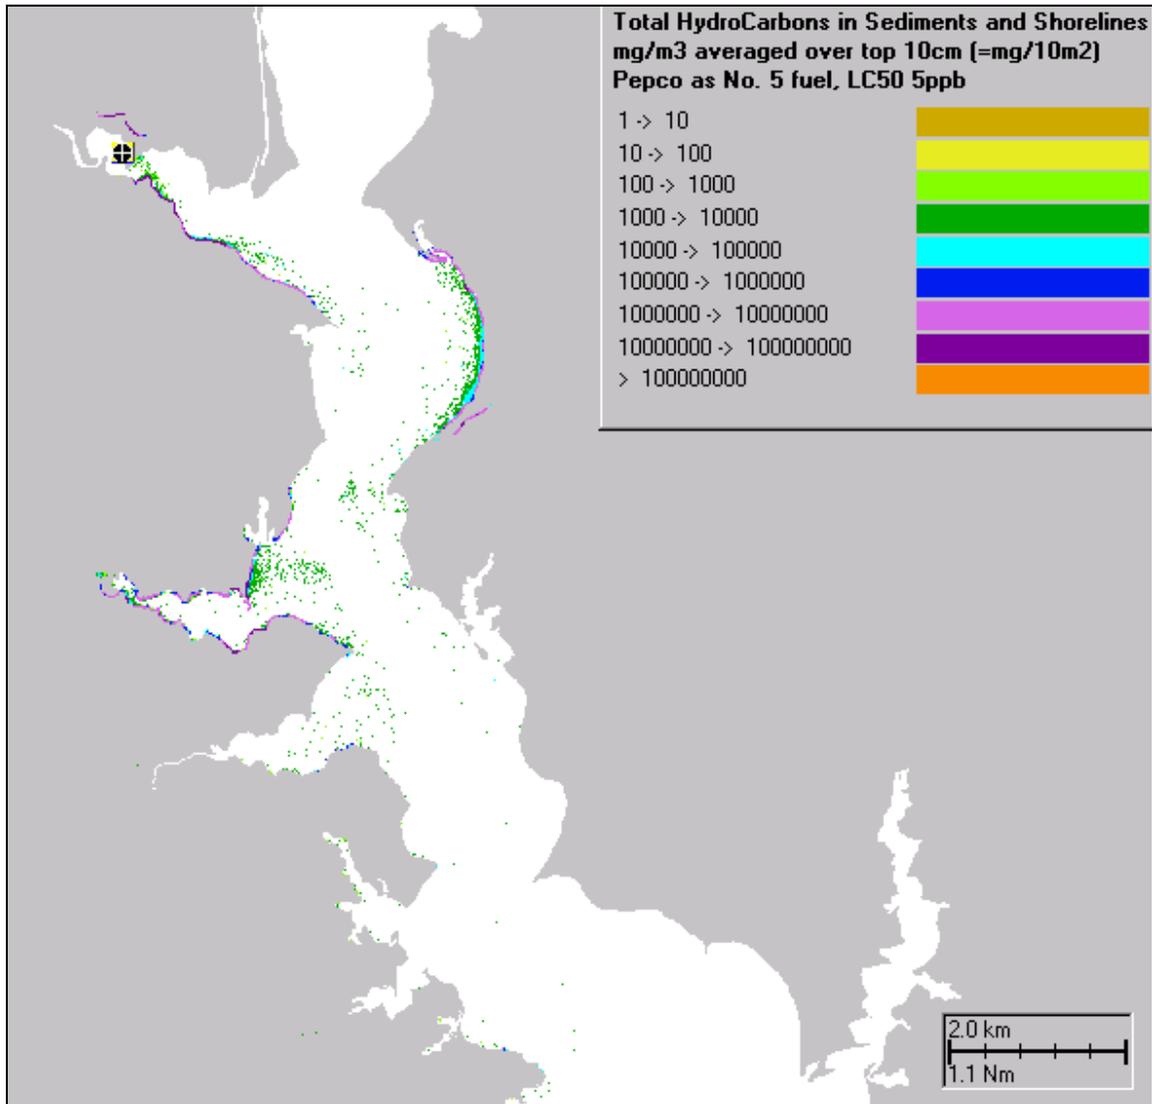

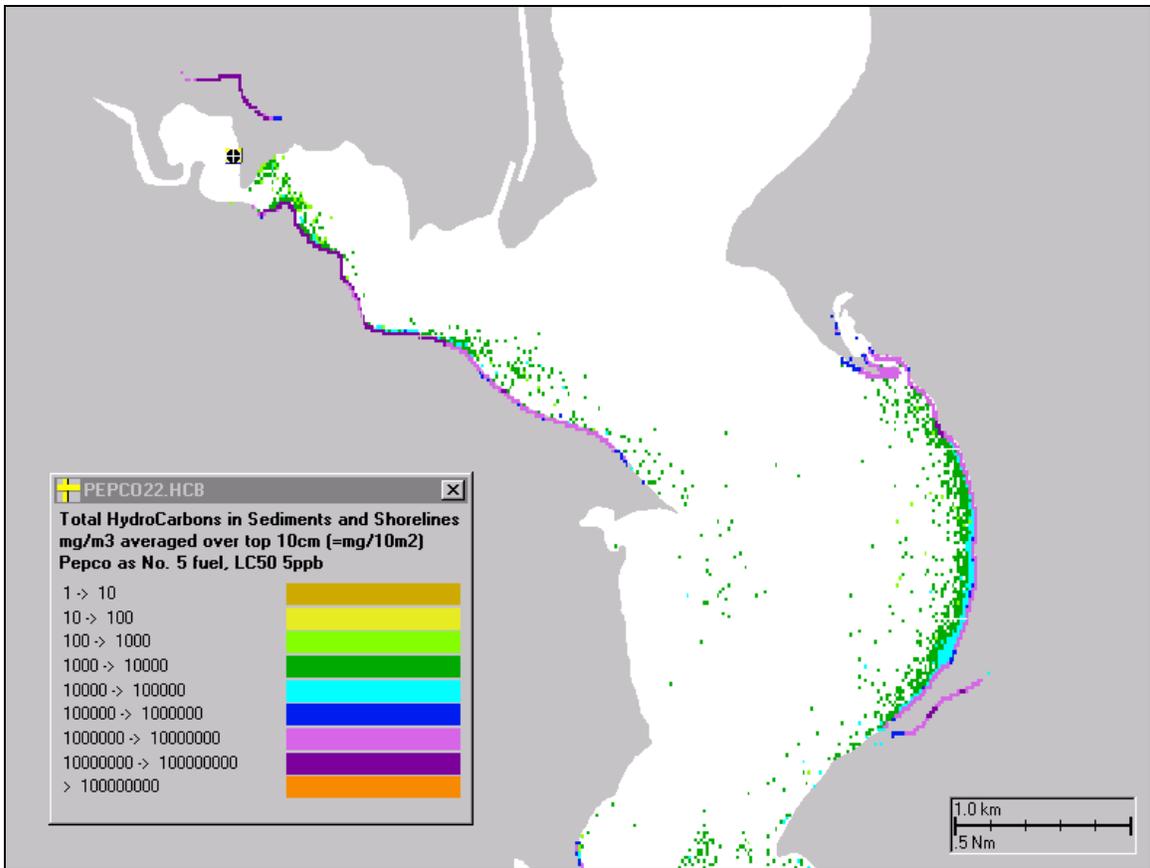

Appendix H. Modeled Total Hydrocarbon Deposition on Sediments and Shorelines by Two Weeks after the Spill

The following figures show mass of total hydrocarbons in sediments and on shorelines at two weeks after the spill. No shoreline cleanup was simulated in the model. Thus, oil simply accumulates and remains on the shore.

Note that the shoreline shown in these model outputs are for visual reference only, whereas the habitat (and corresponding depth) grid (Appendices B and C) defines the actual shoreline to the model.

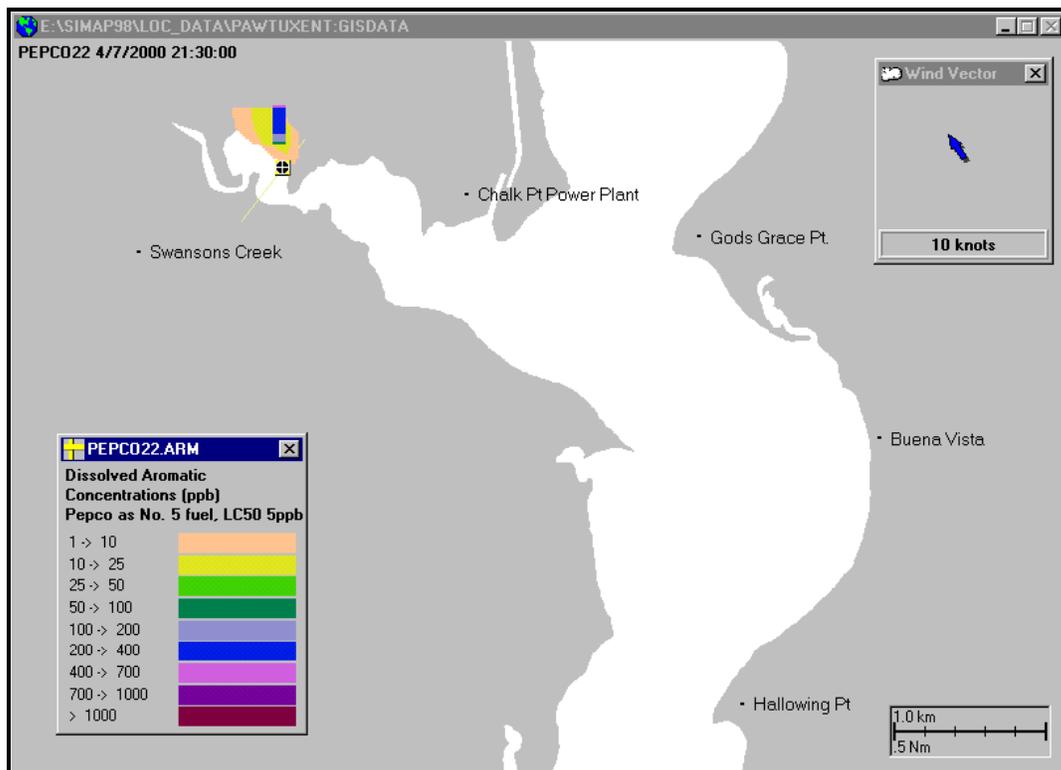

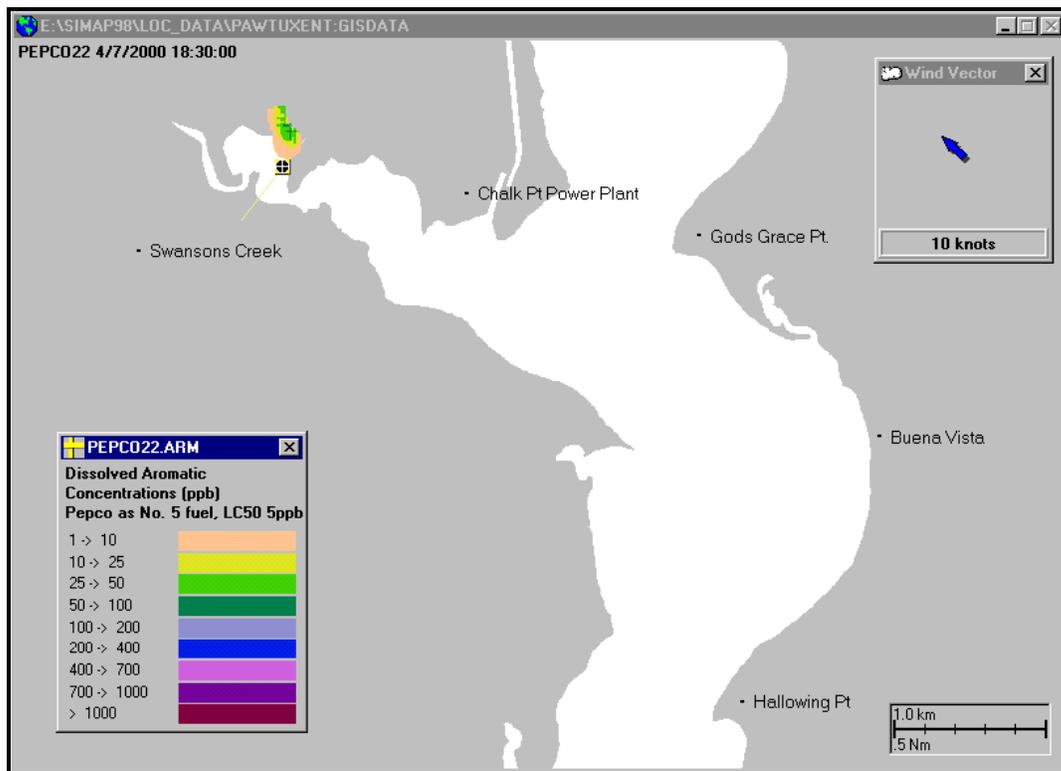

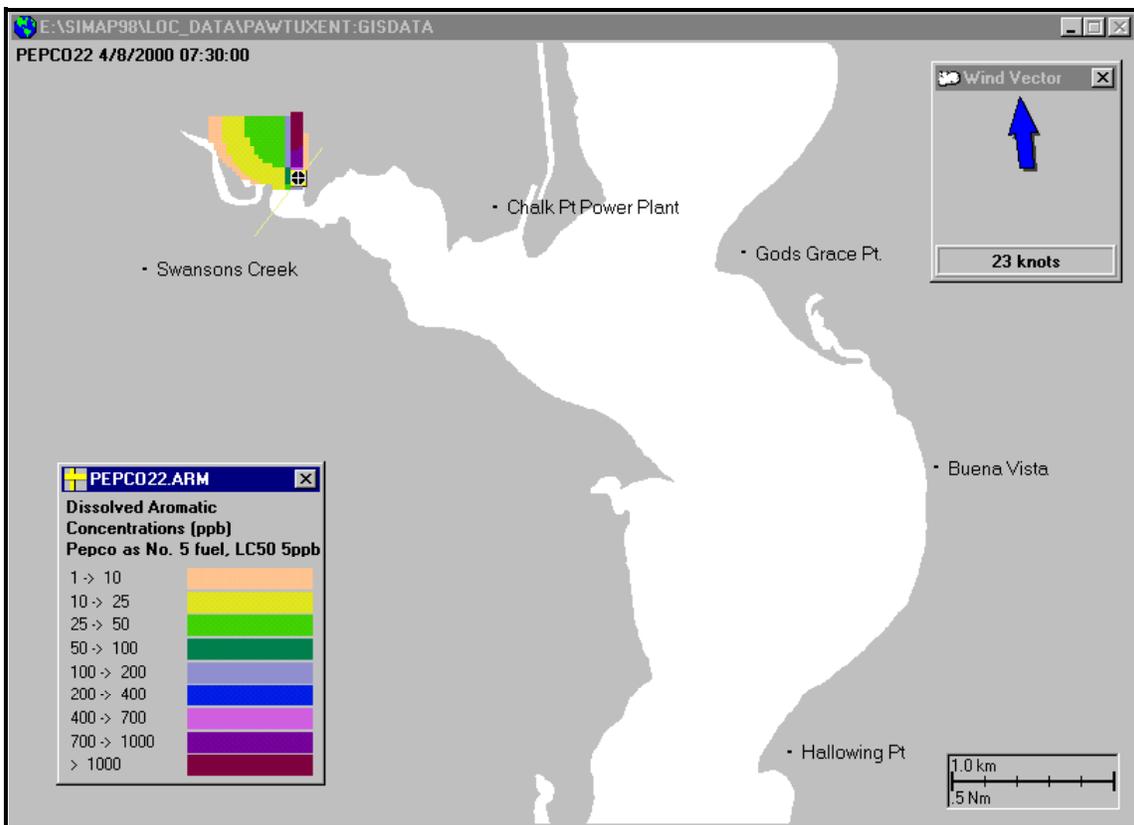

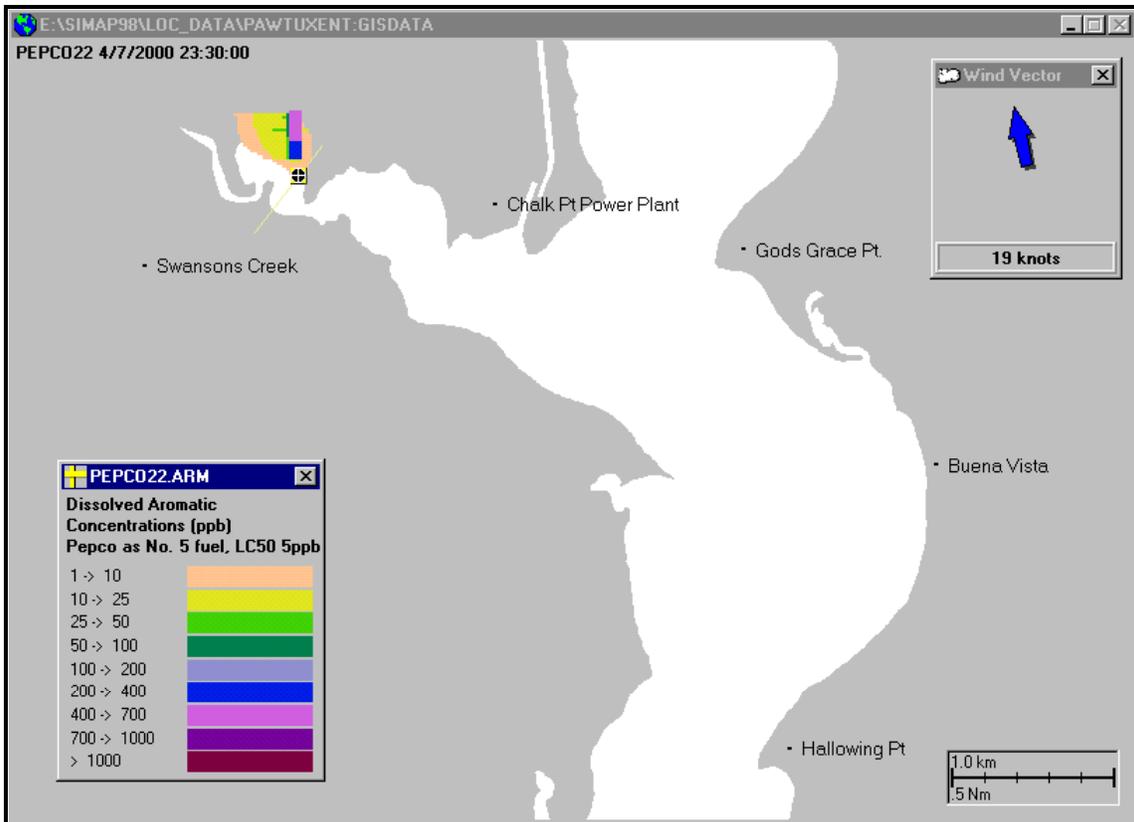

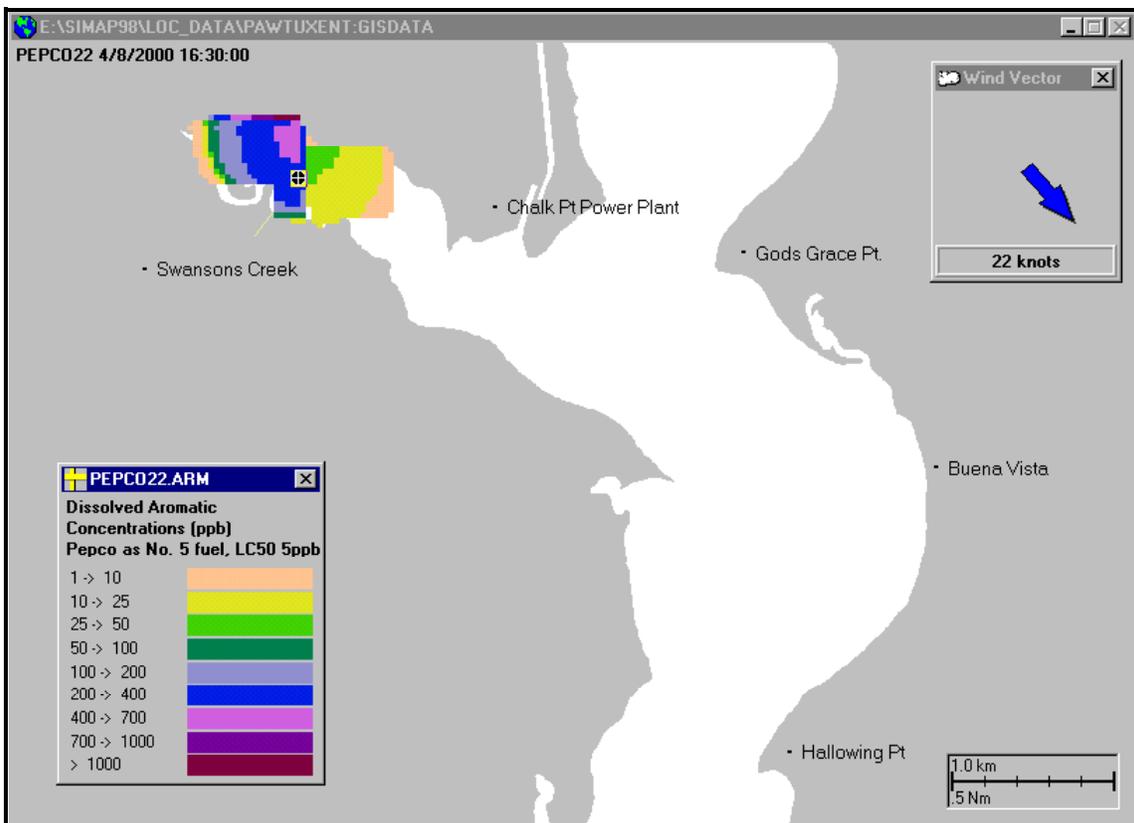

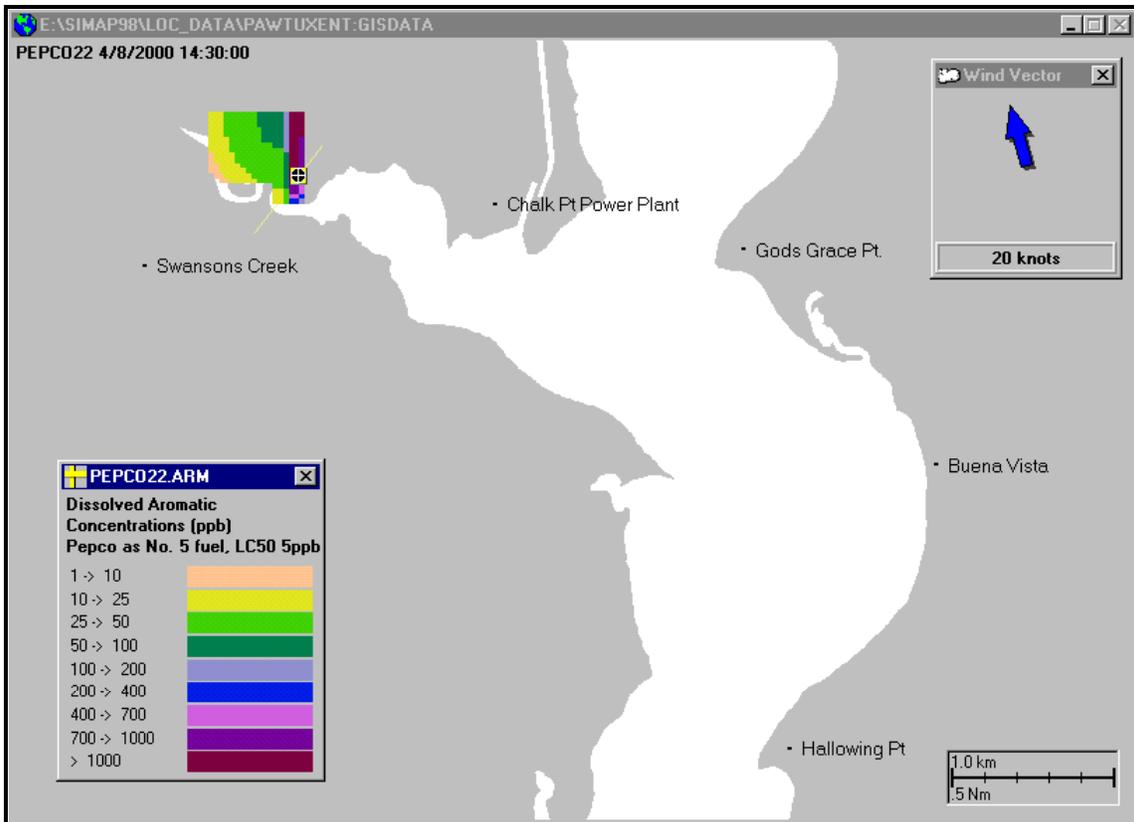

Appendix I. Modeled PAH Concentrations over Time

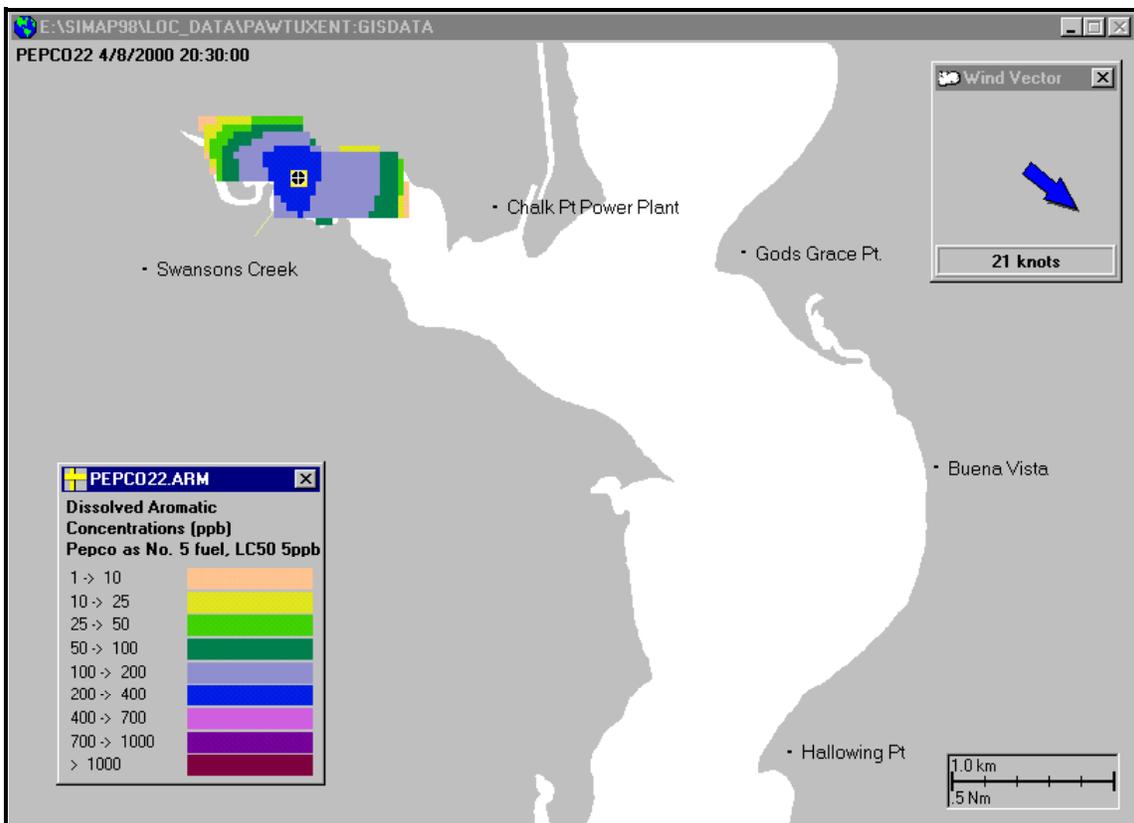

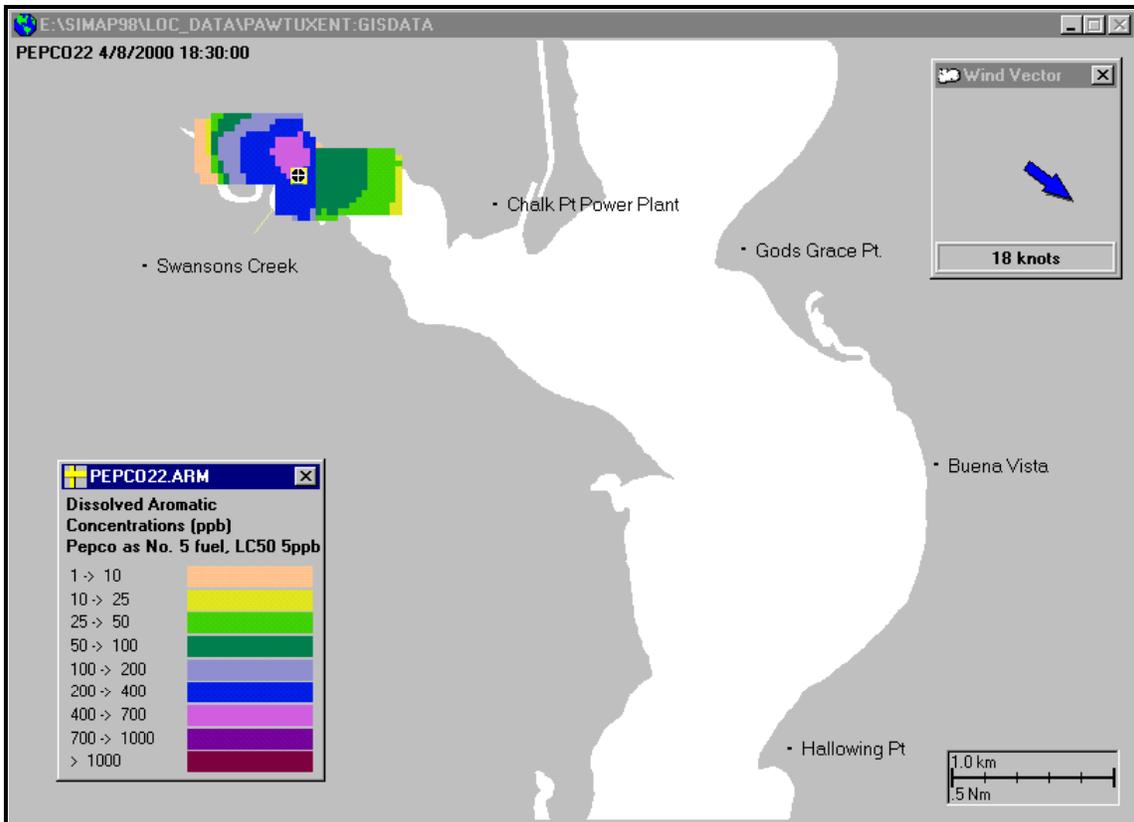

The following figures show concentrations of dissolved PAHs (2-4 ring) in the water after the spill. Concentrations are calculated for a grid (50 X 50 cells horizontally, 5 layers vertically) sized to just cover the plume at the time of the output. The planar view shows vertical maximum concentration.

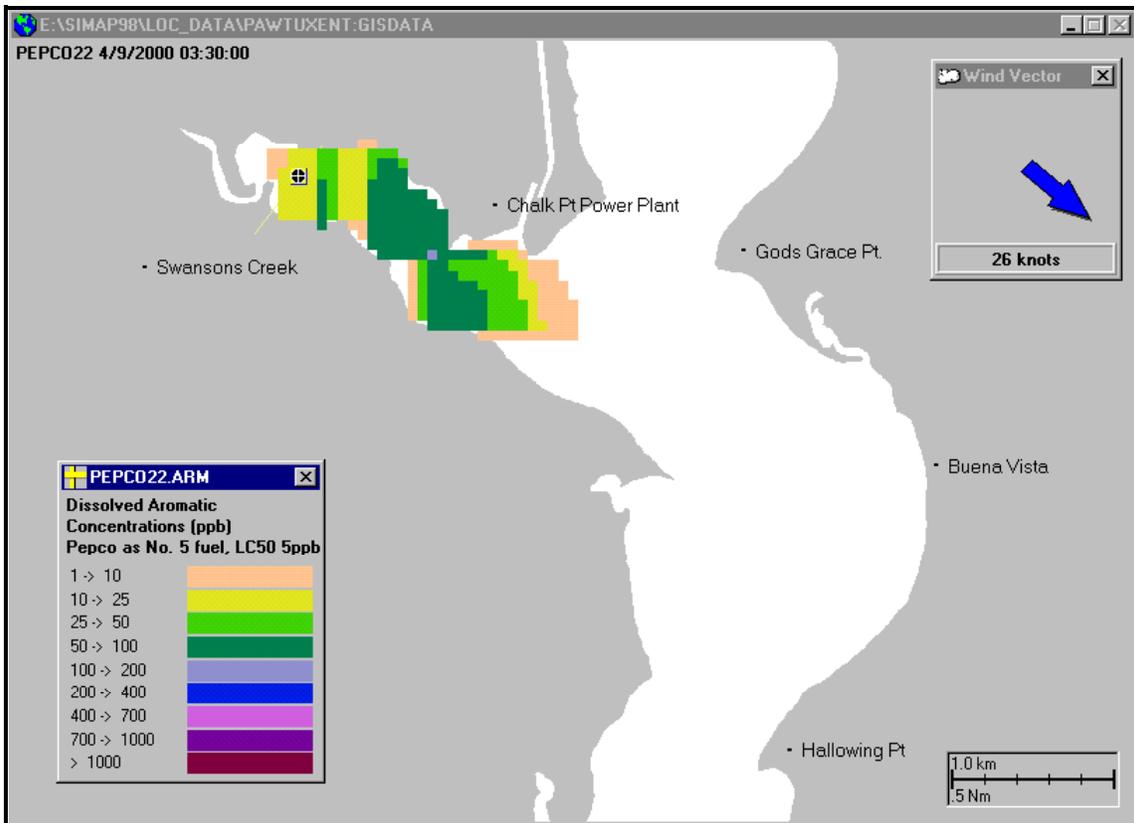

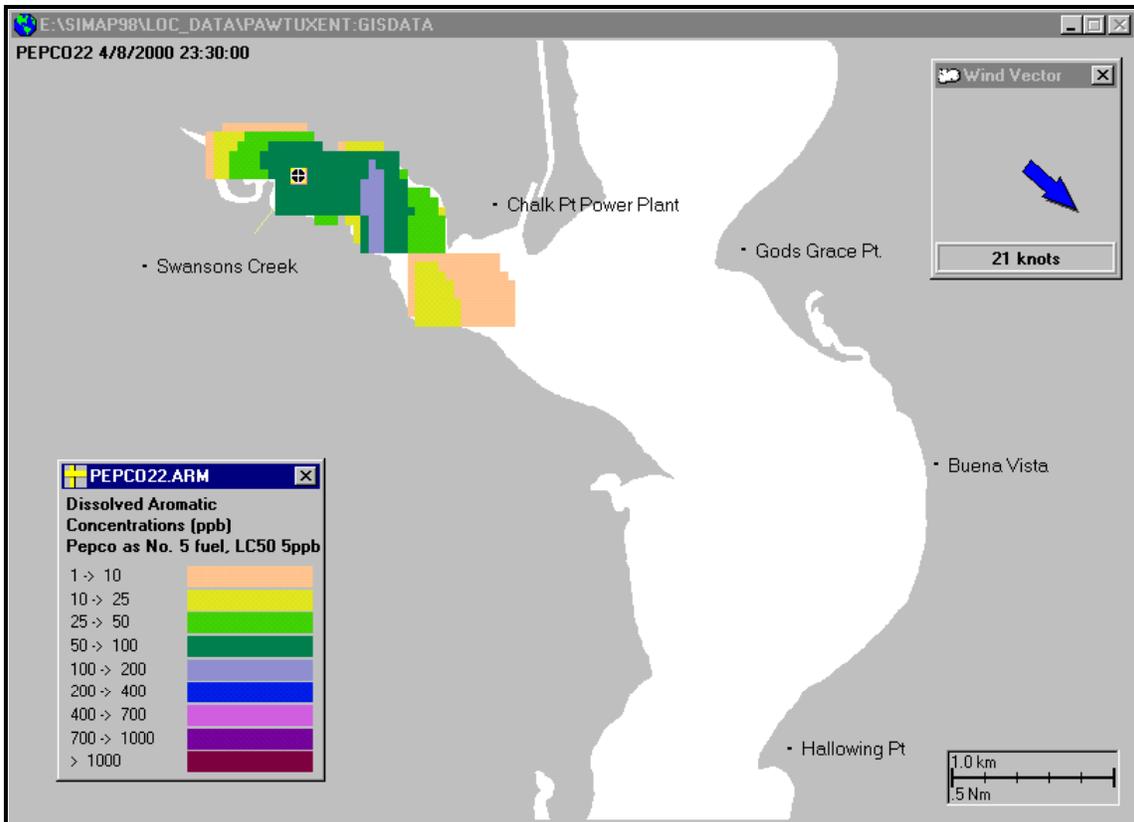

Note that the shoreline shown in these model outputs are for visual reference only, whereas the habitat (and corresponding depth) grid (Appendices B and C) defines the actual shoreline to the model.

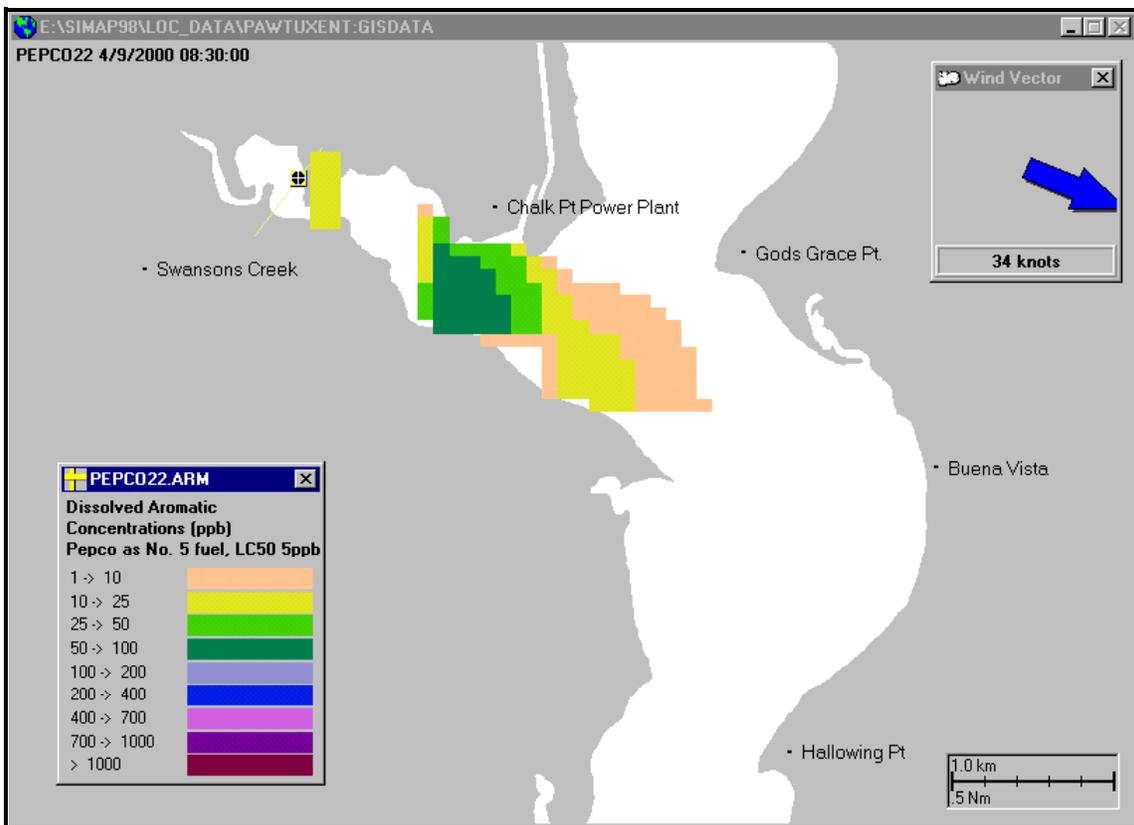

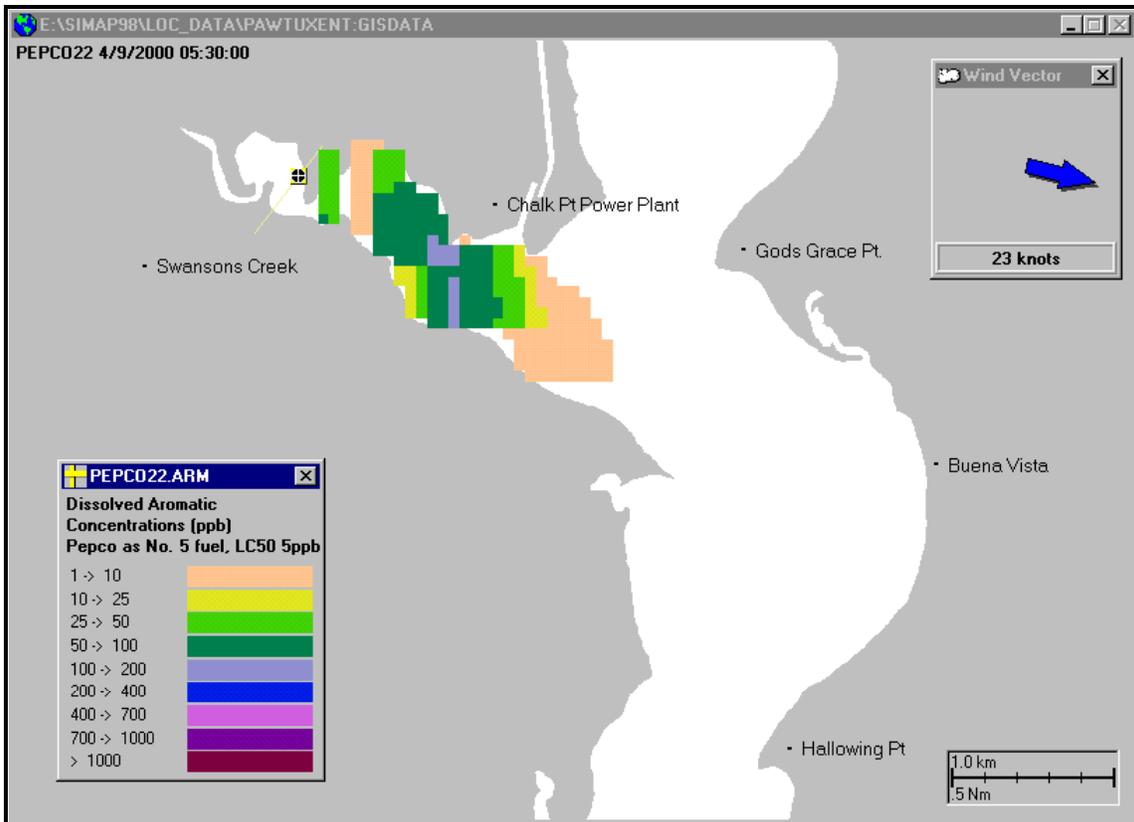

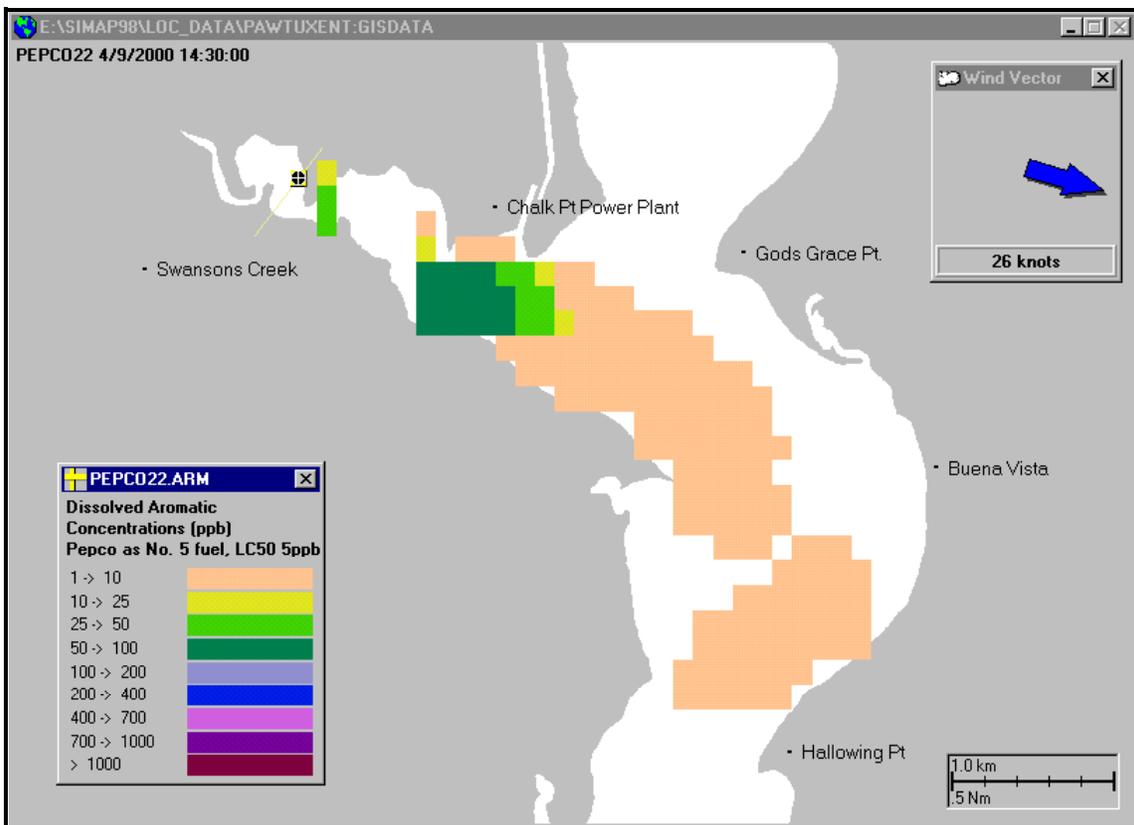

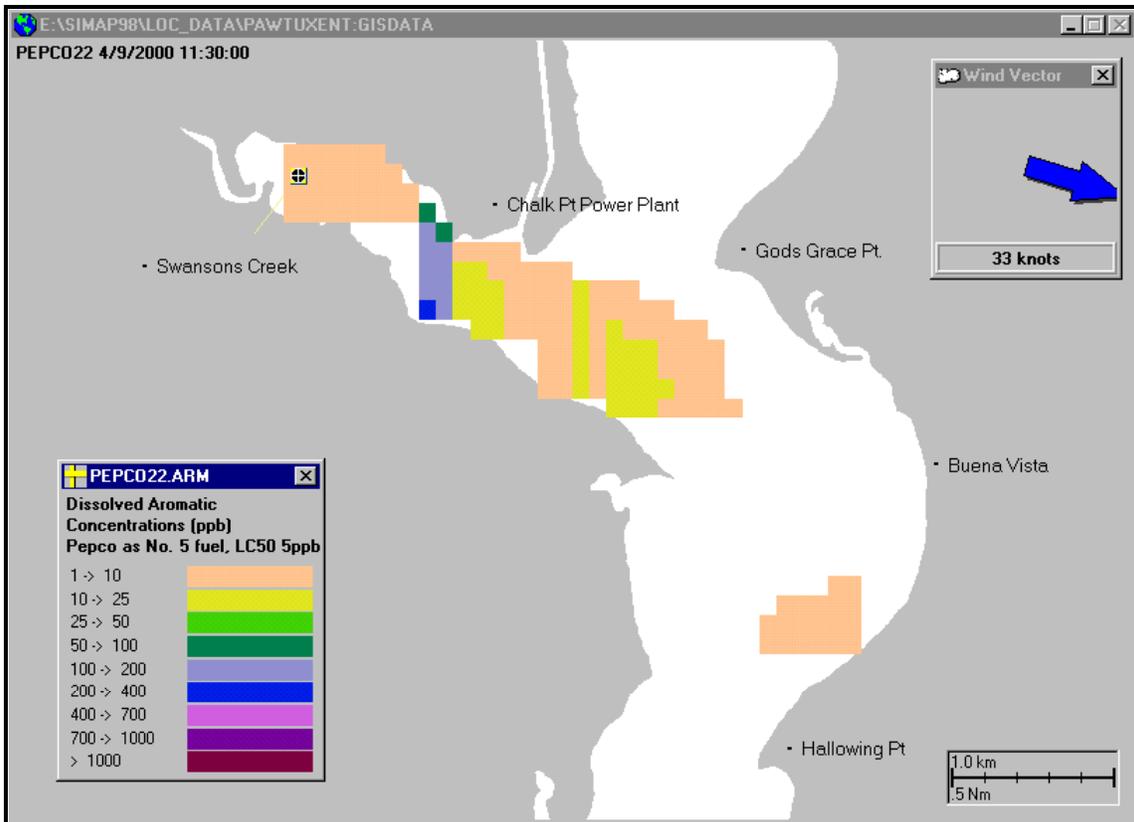

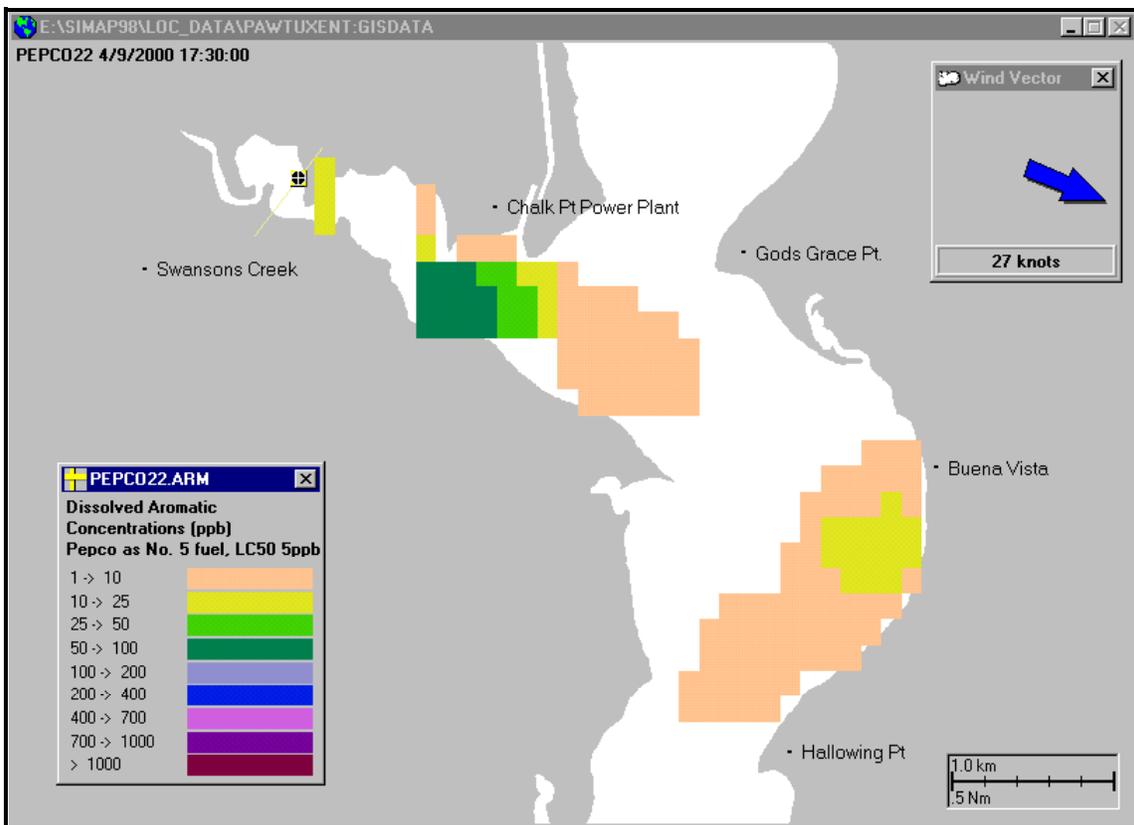

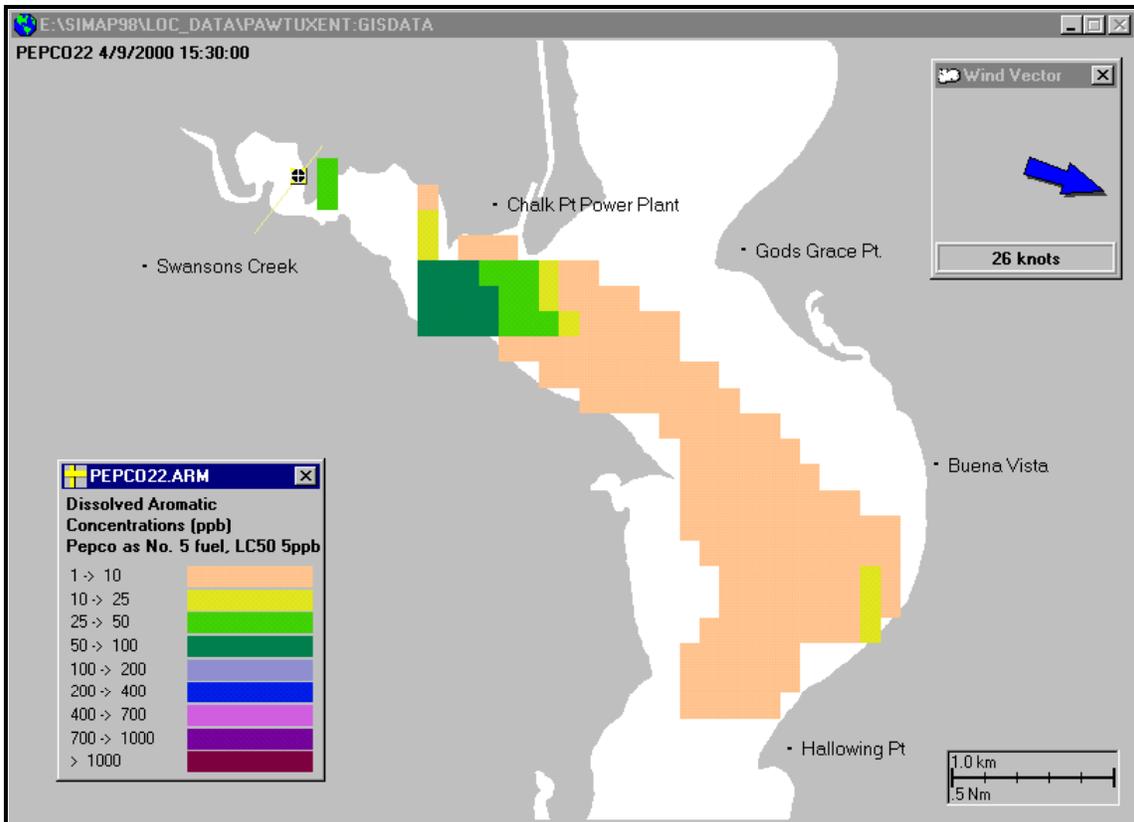

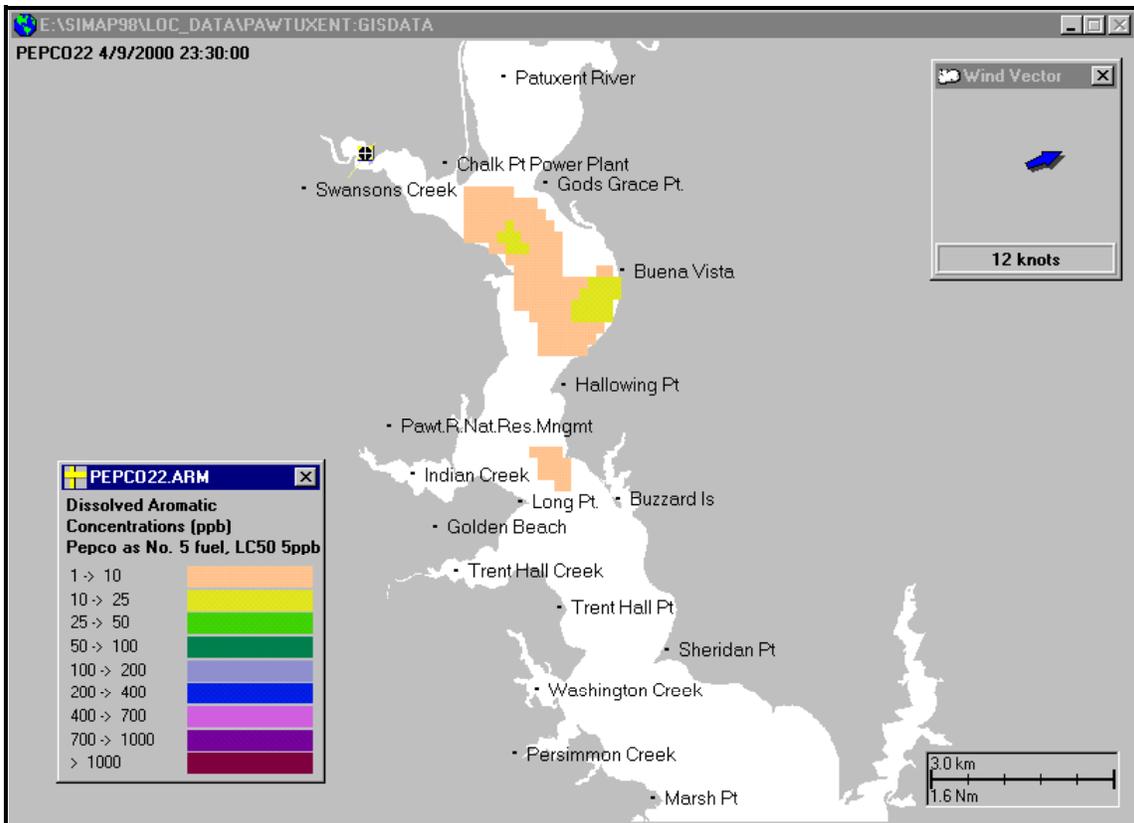

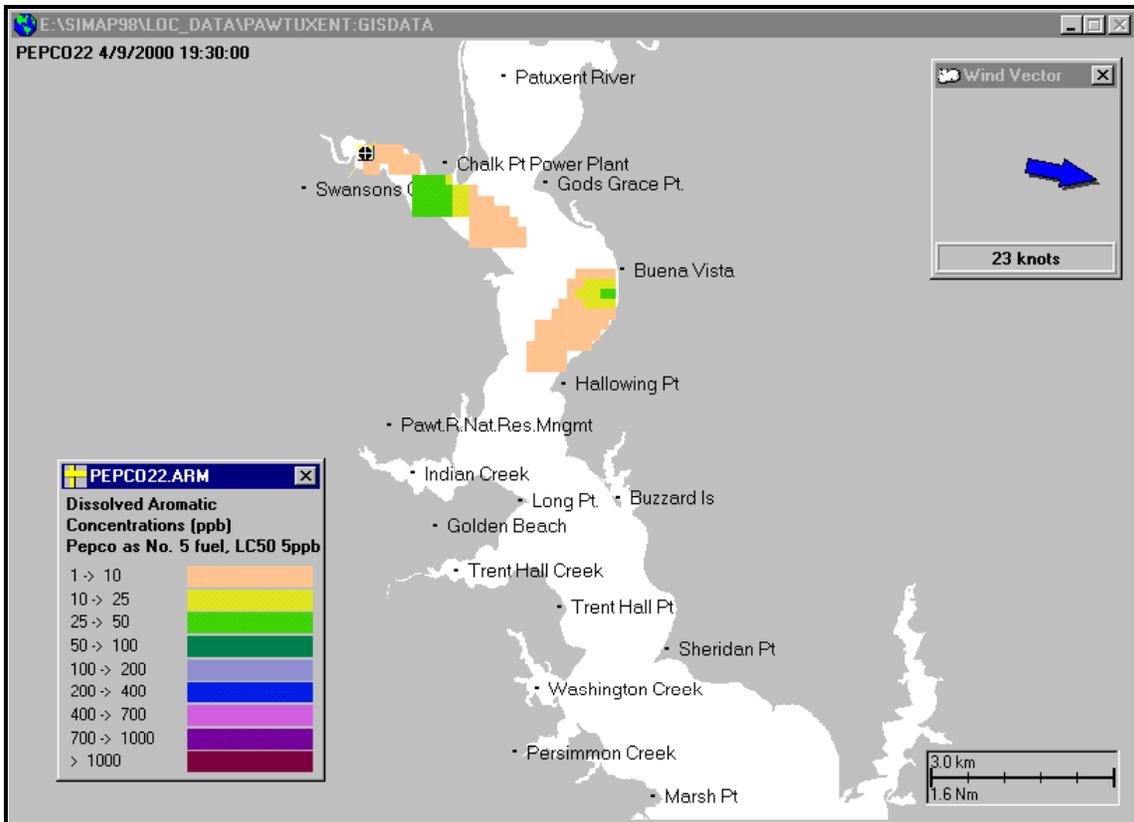

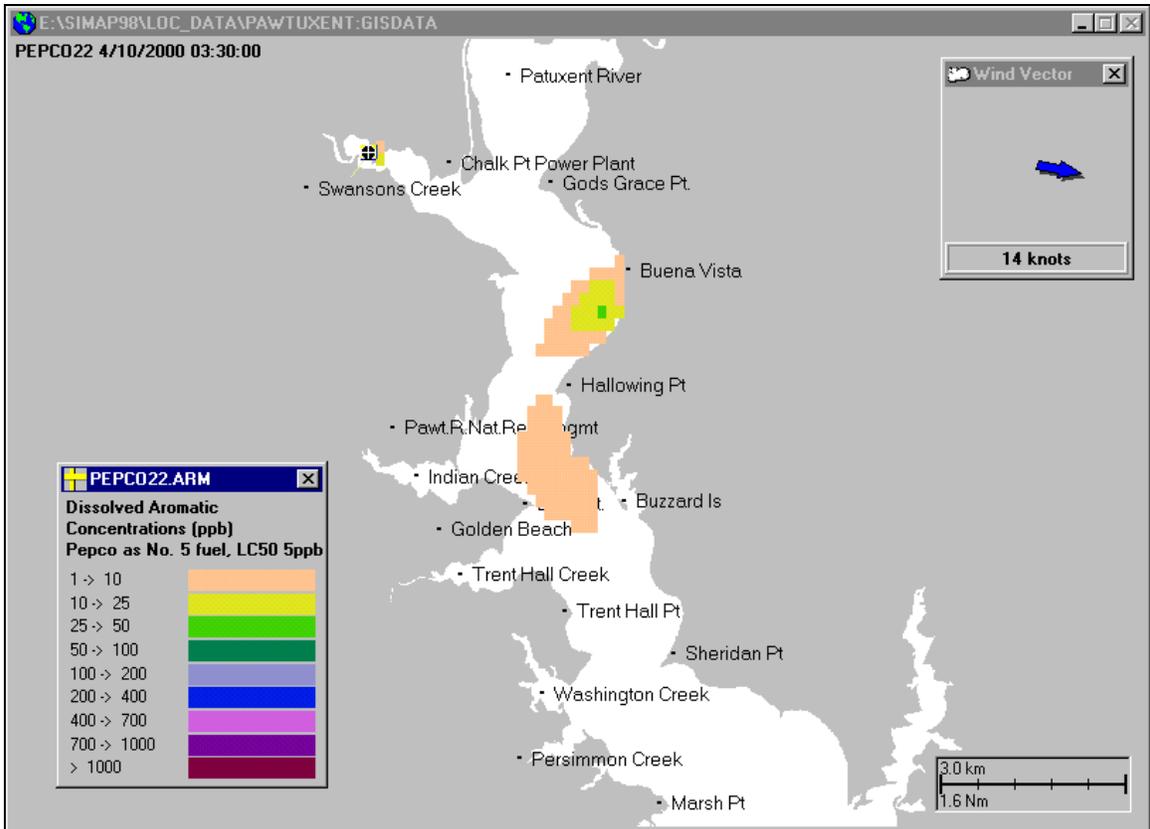

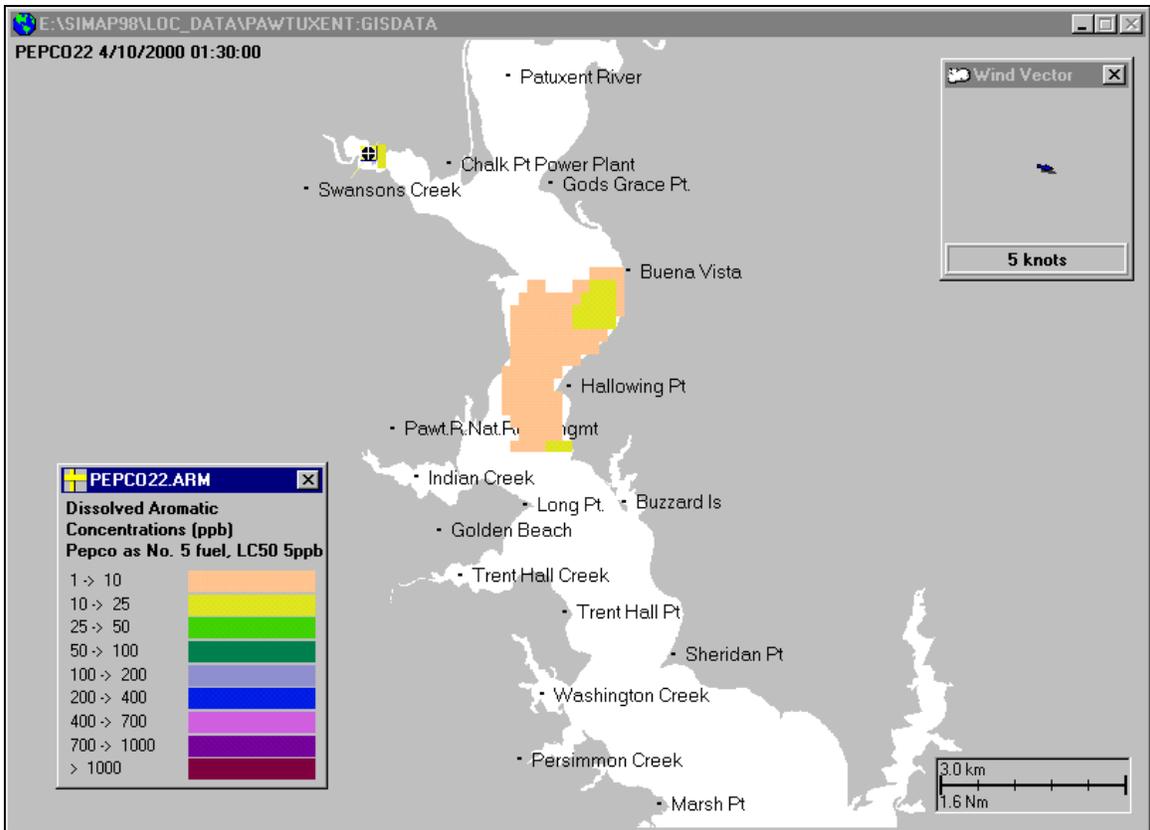

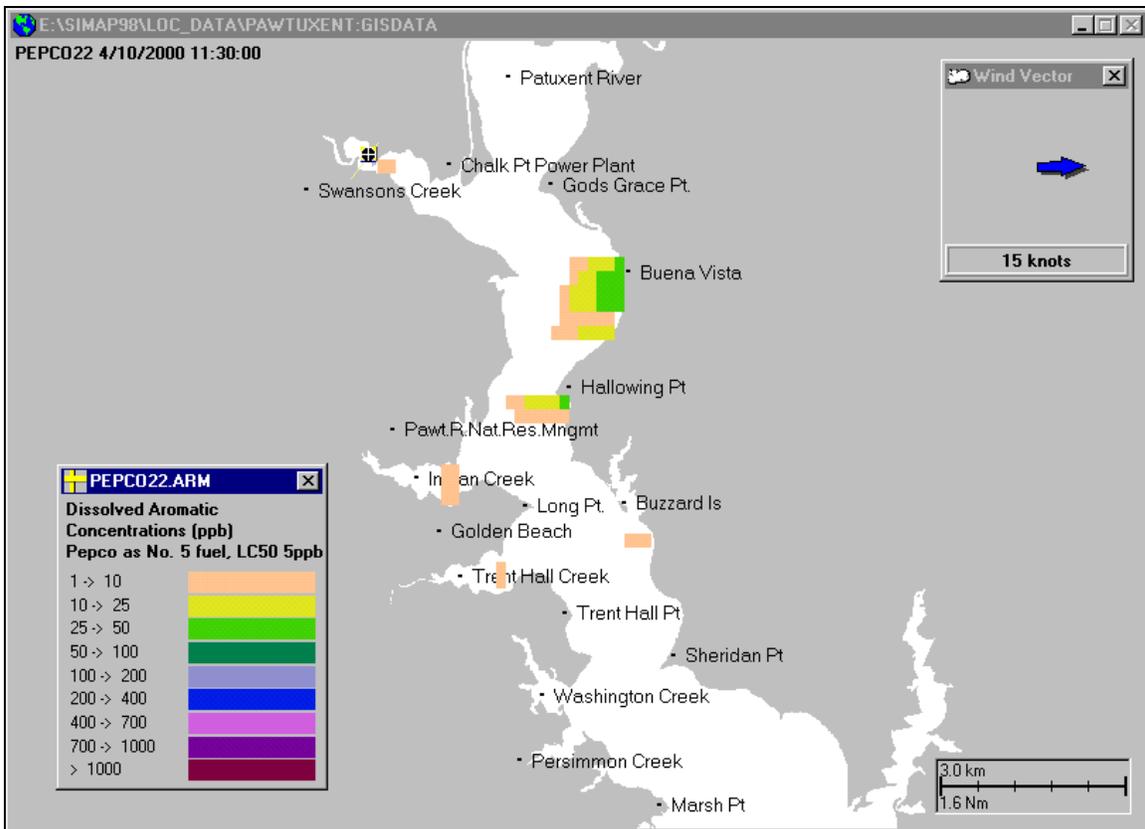

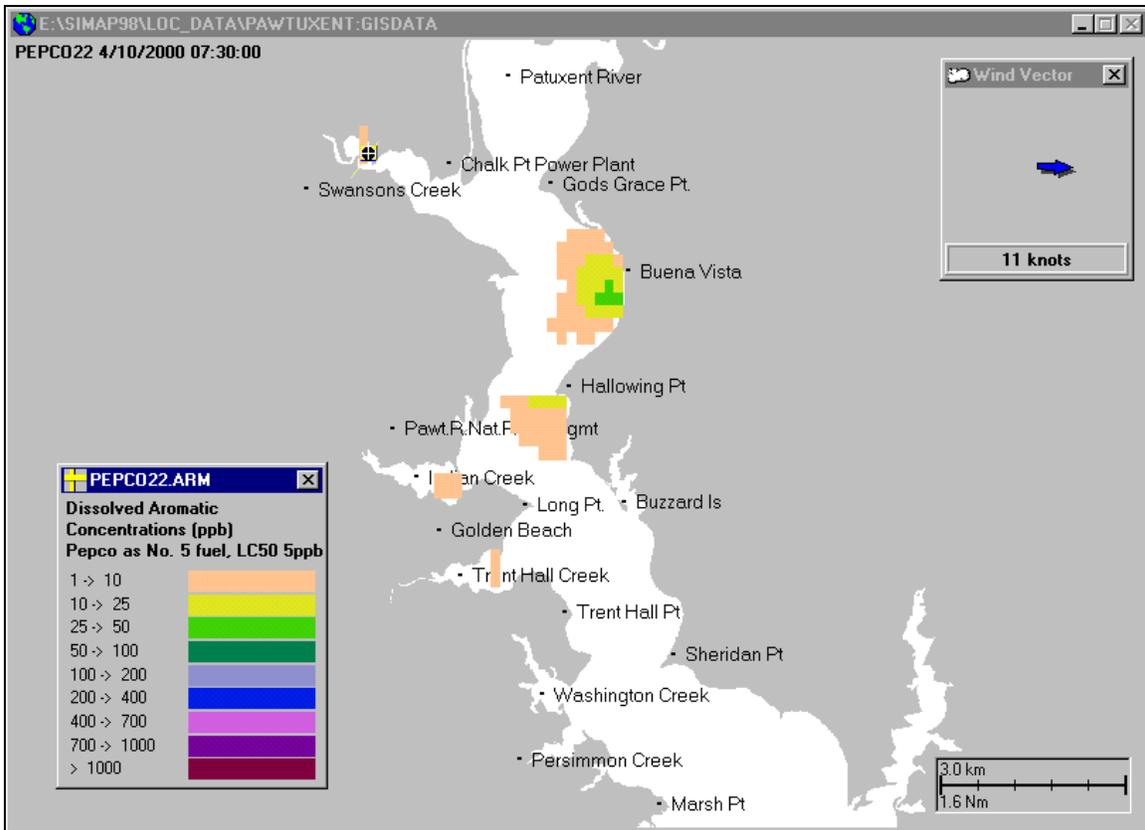

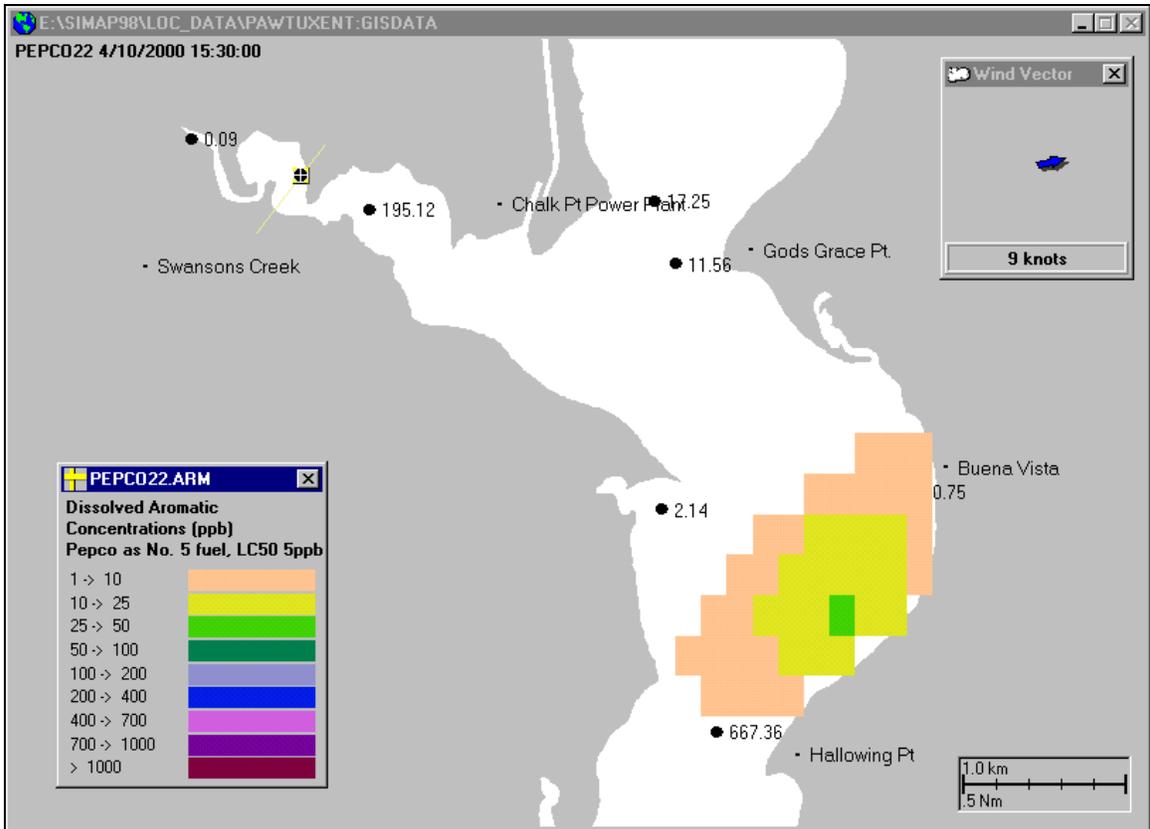

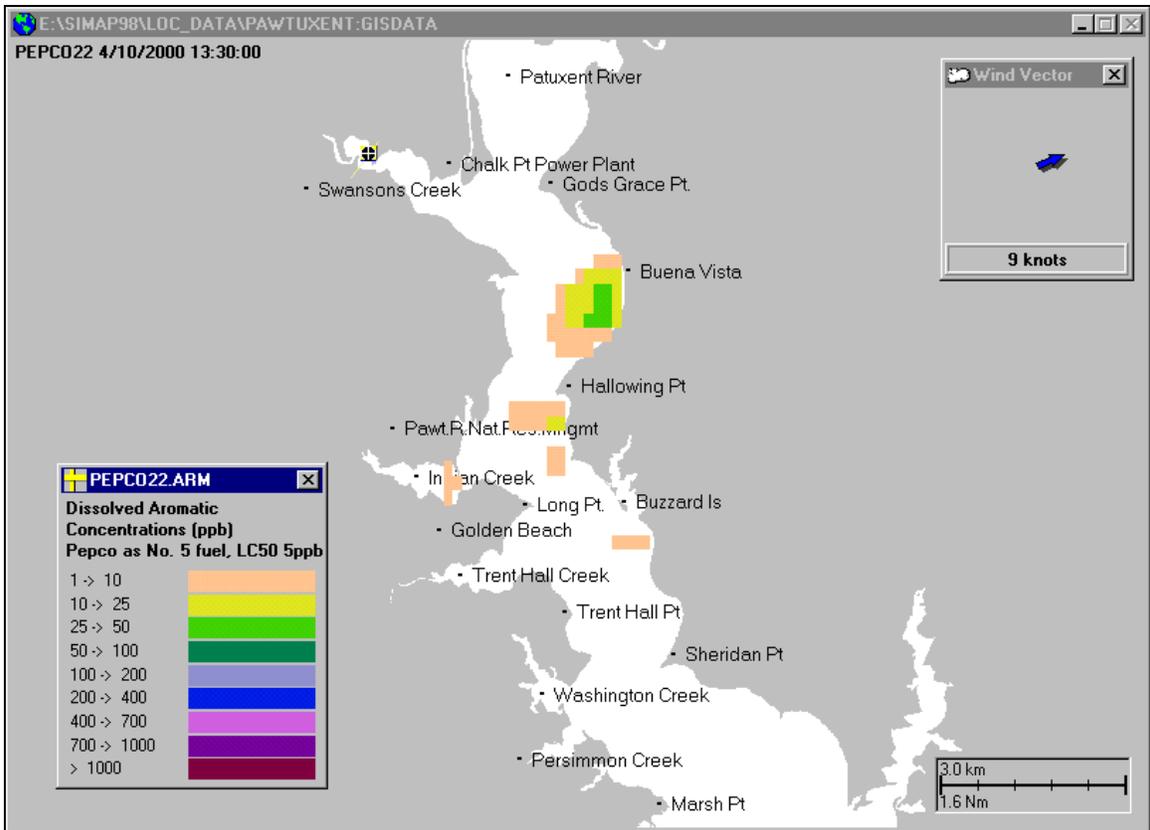

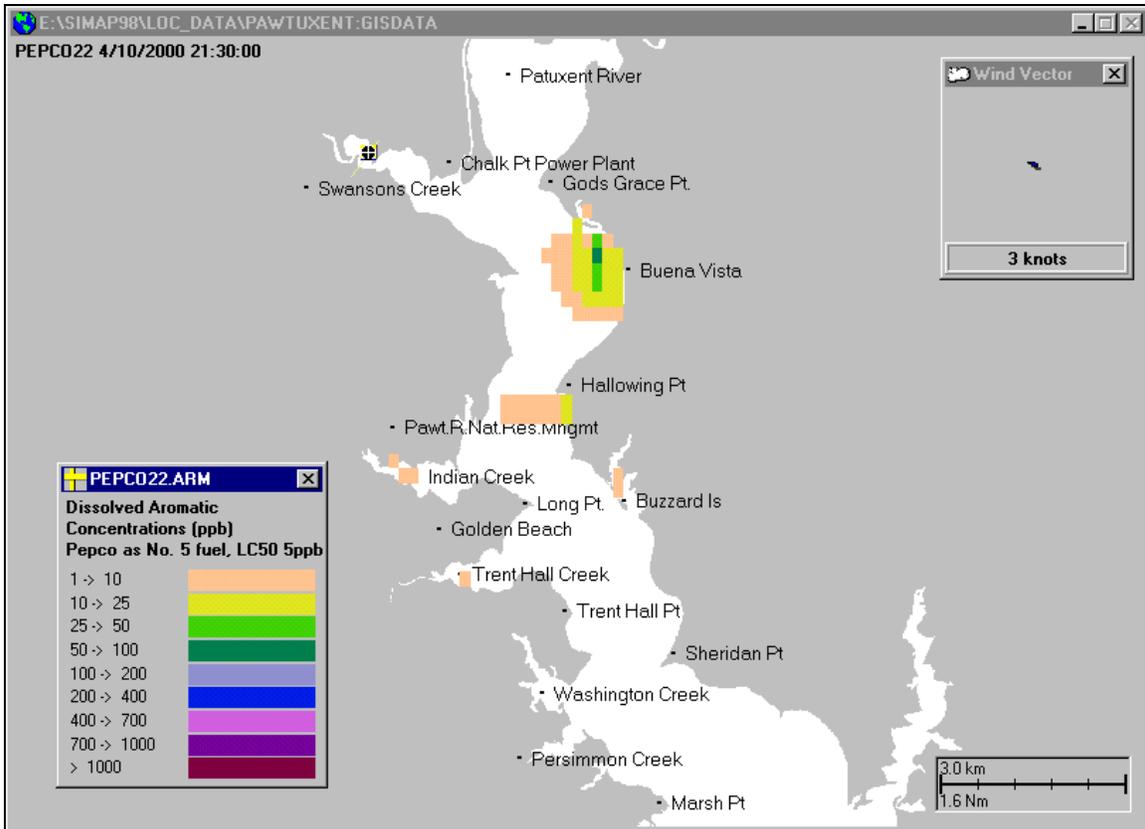

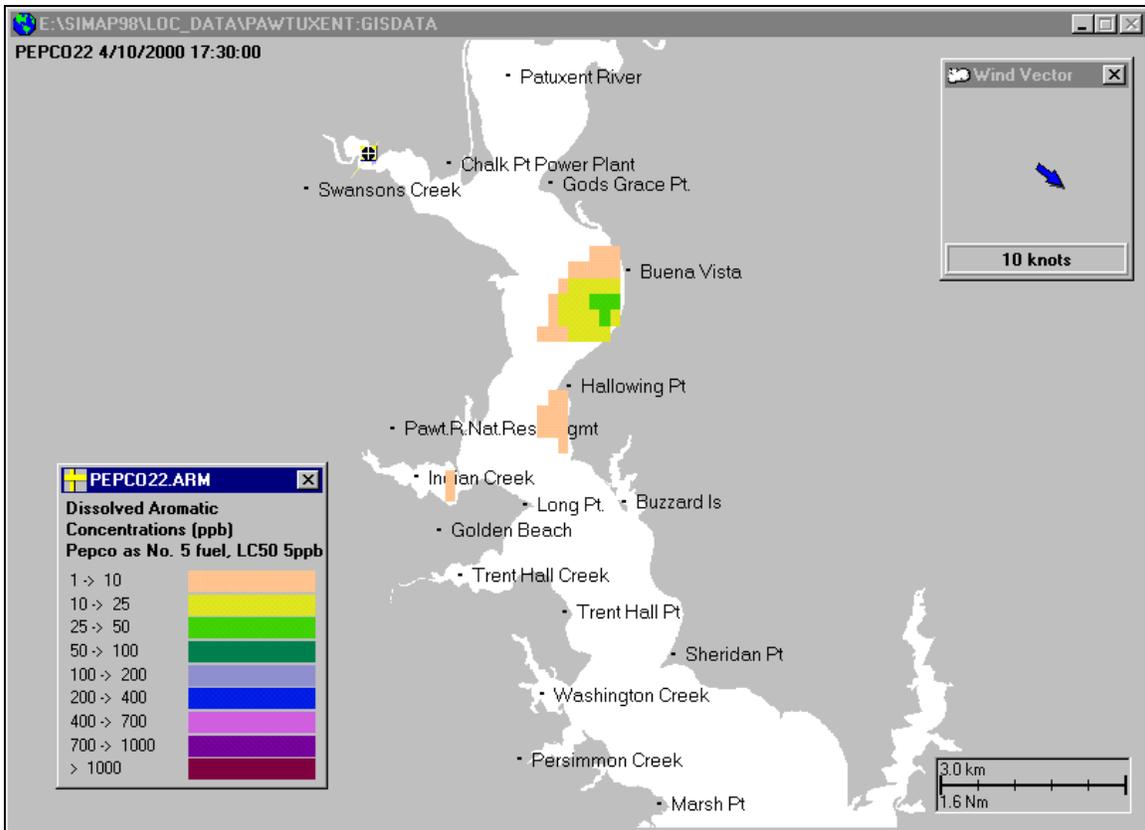

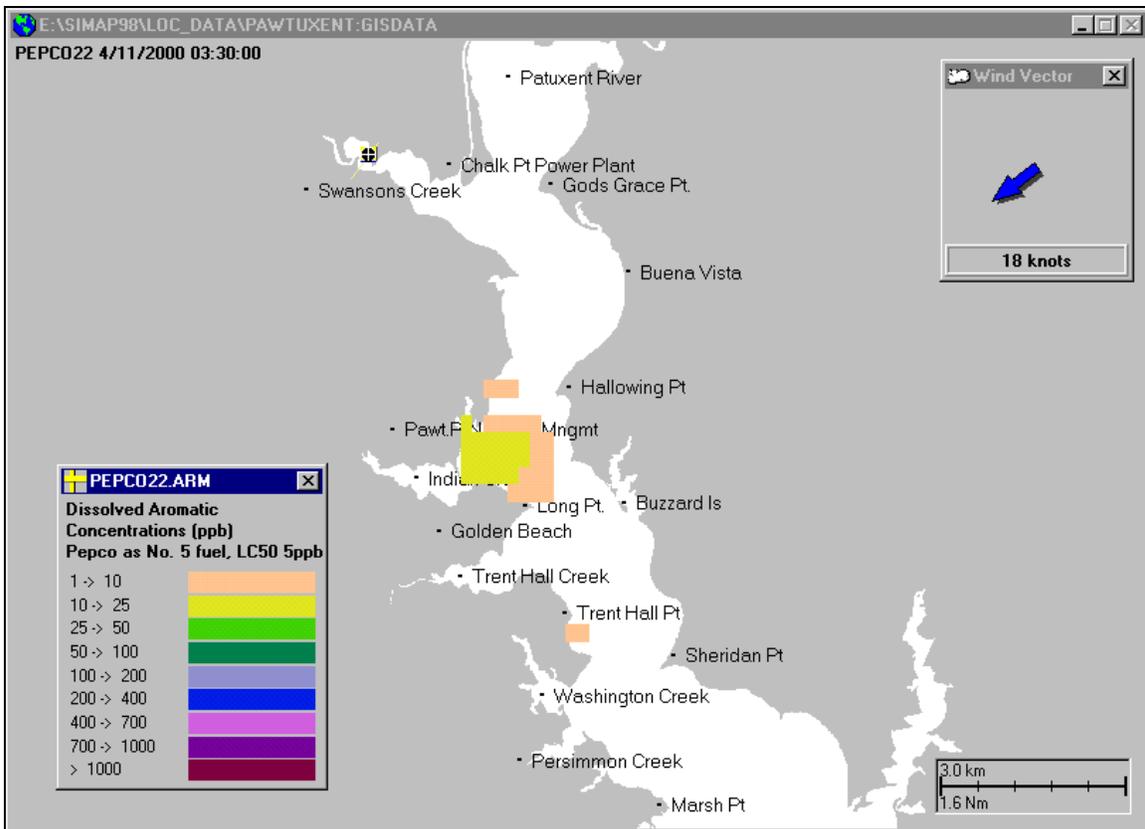

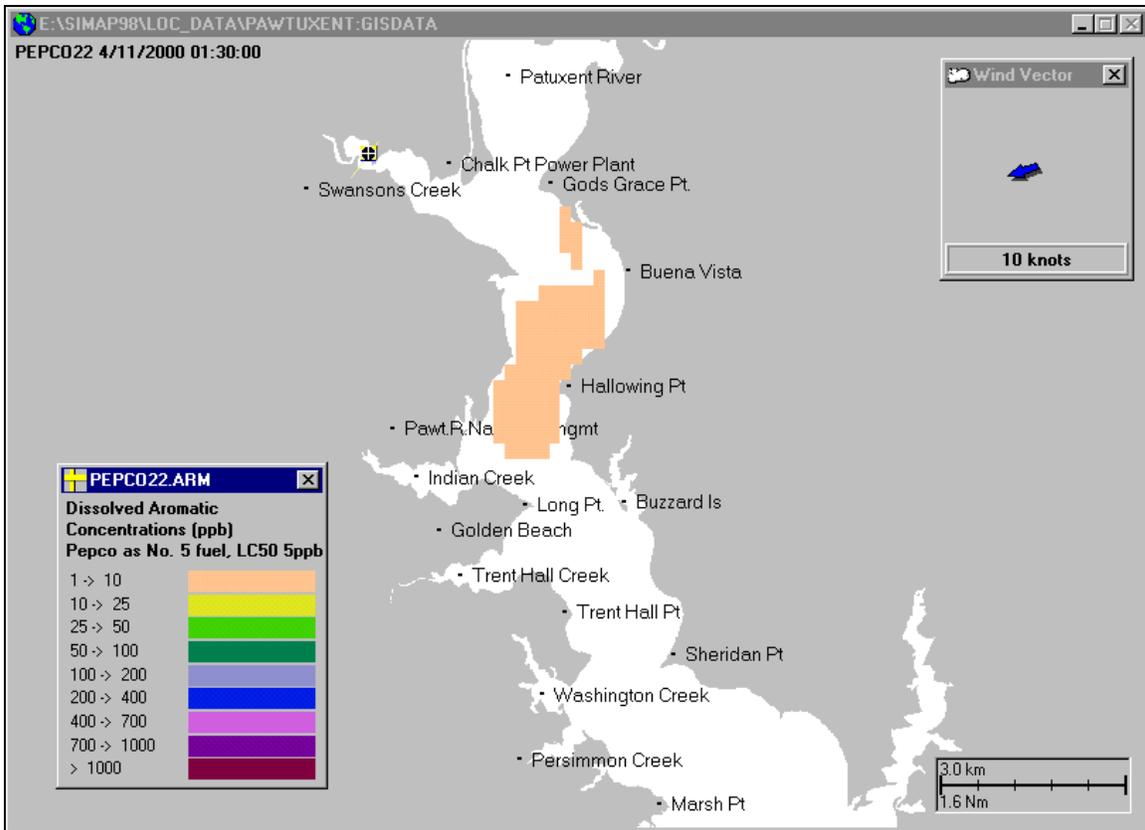

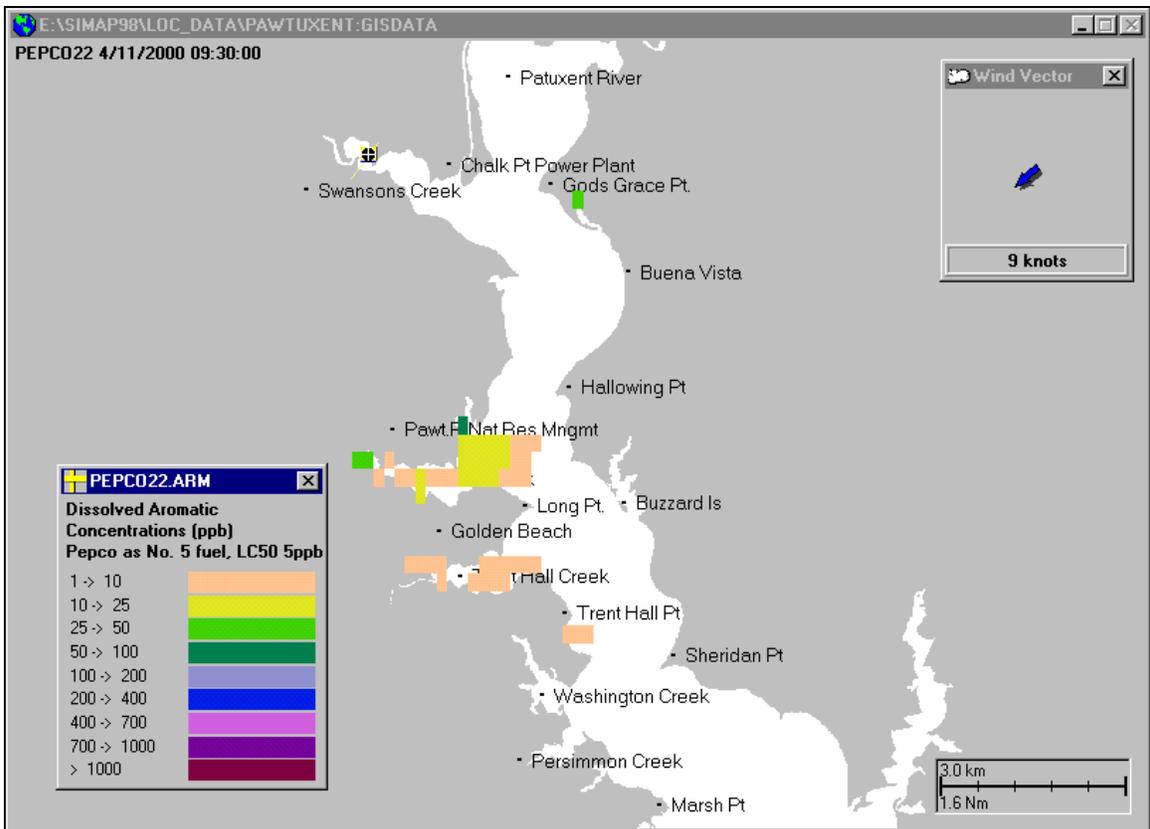

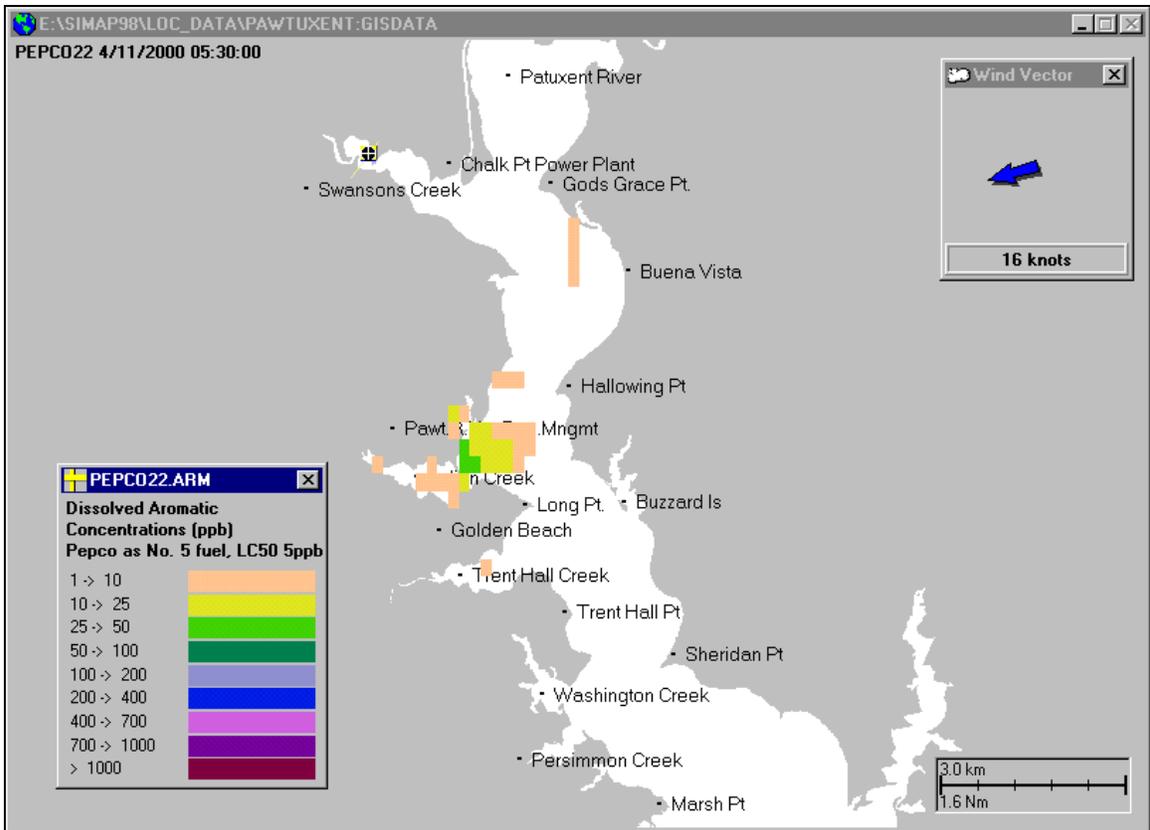

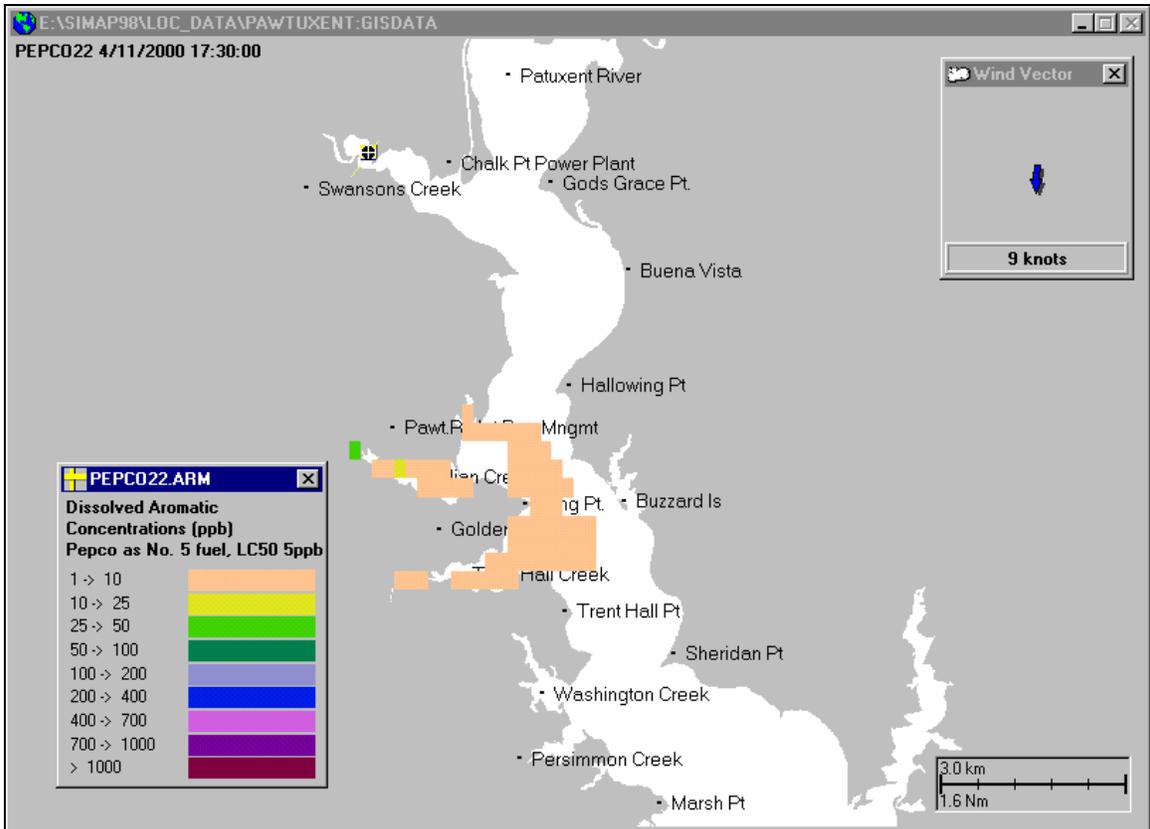

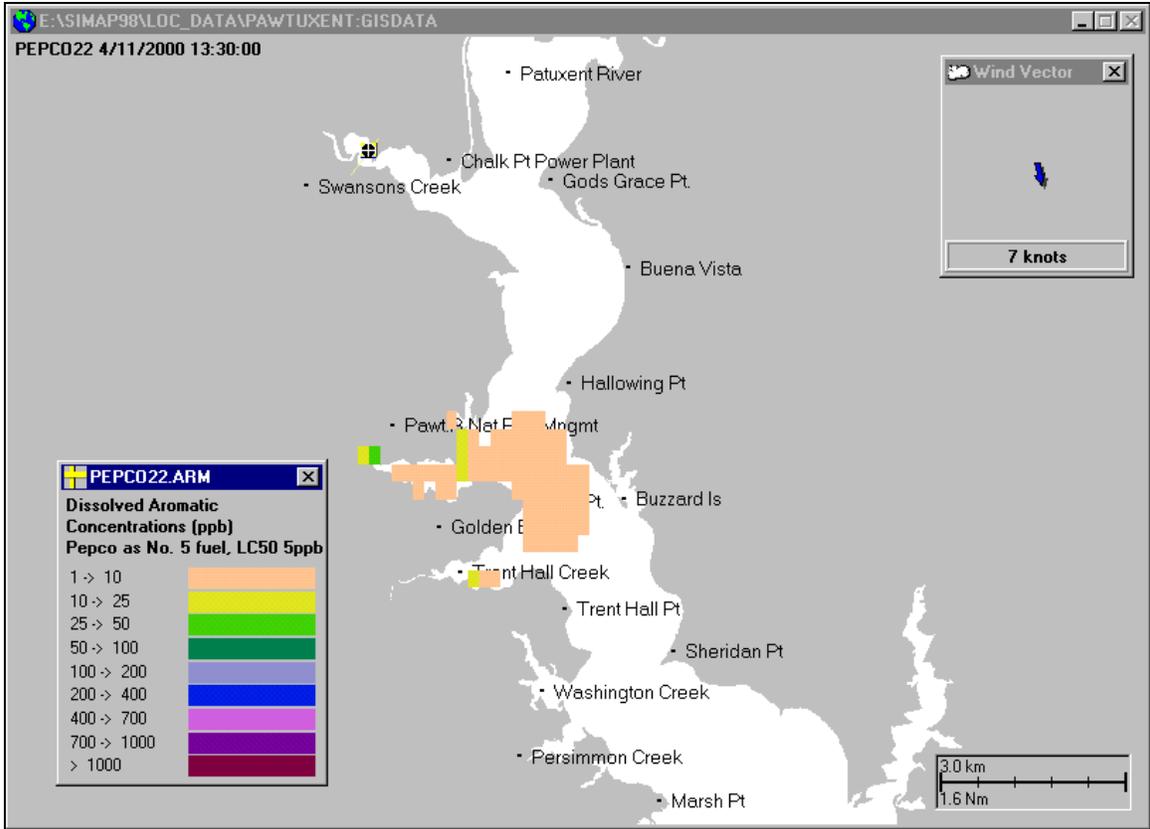

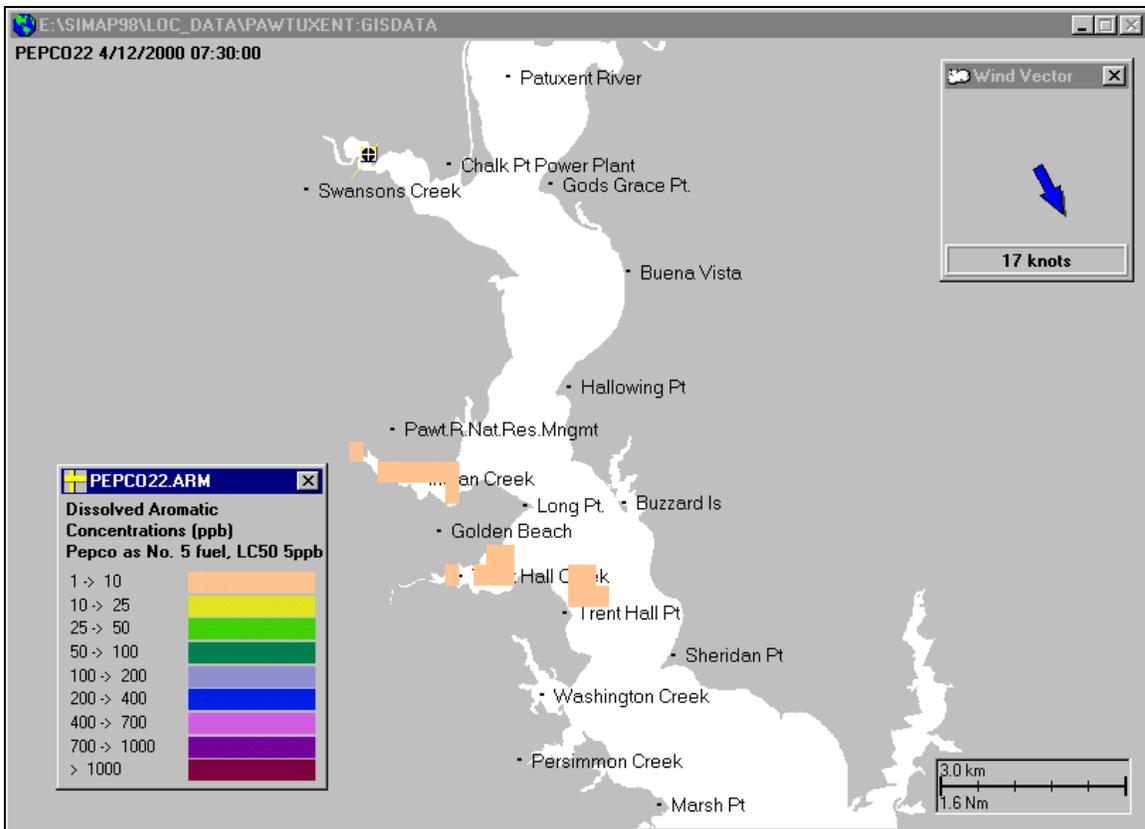

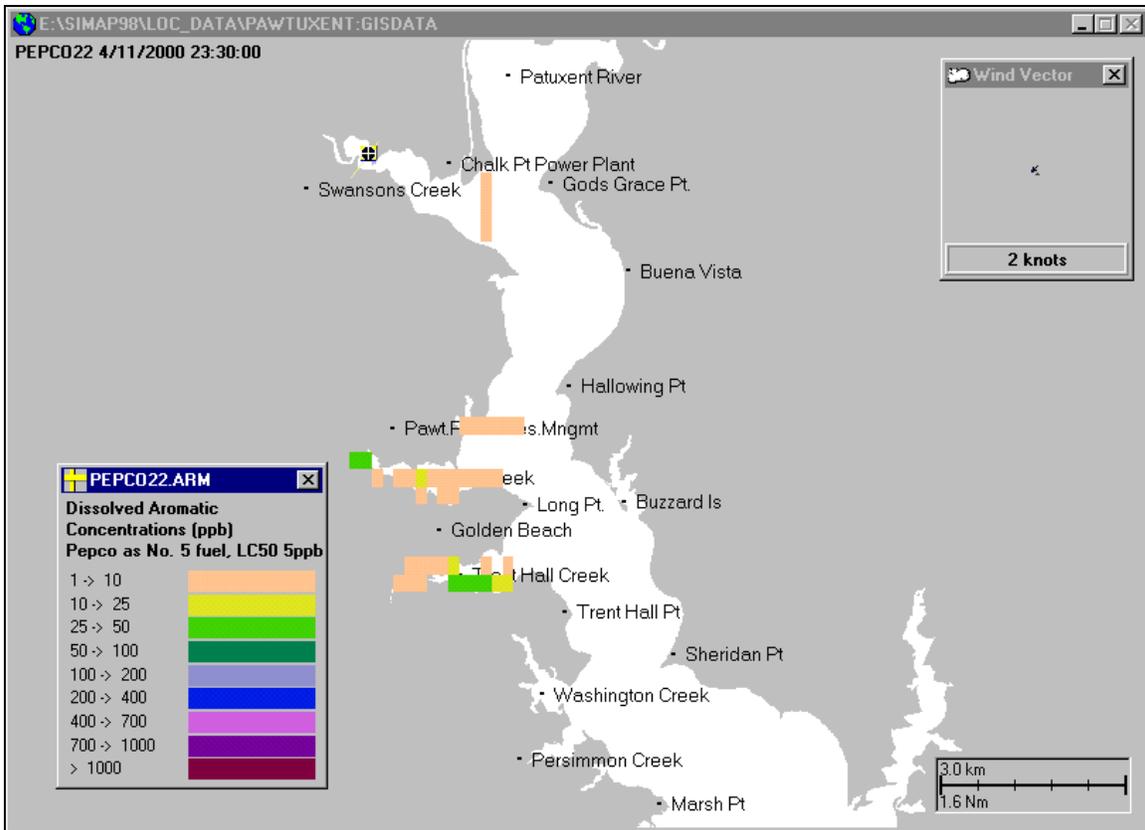

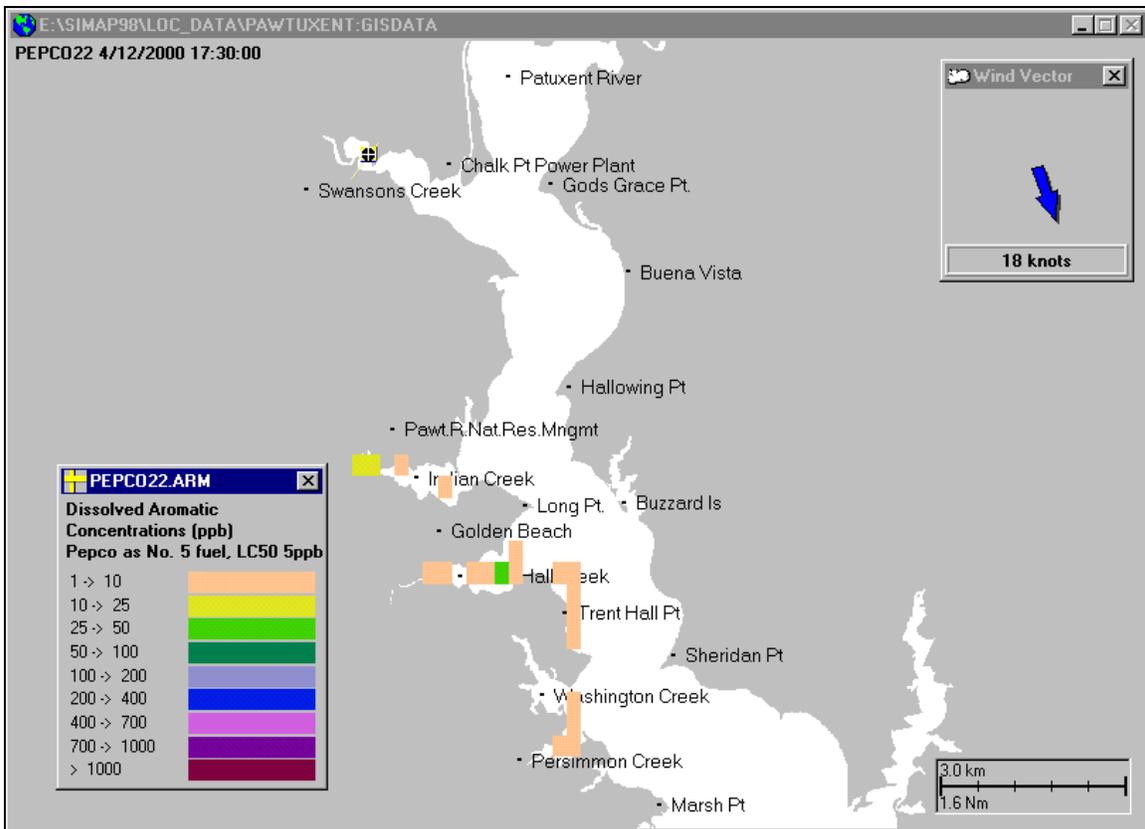

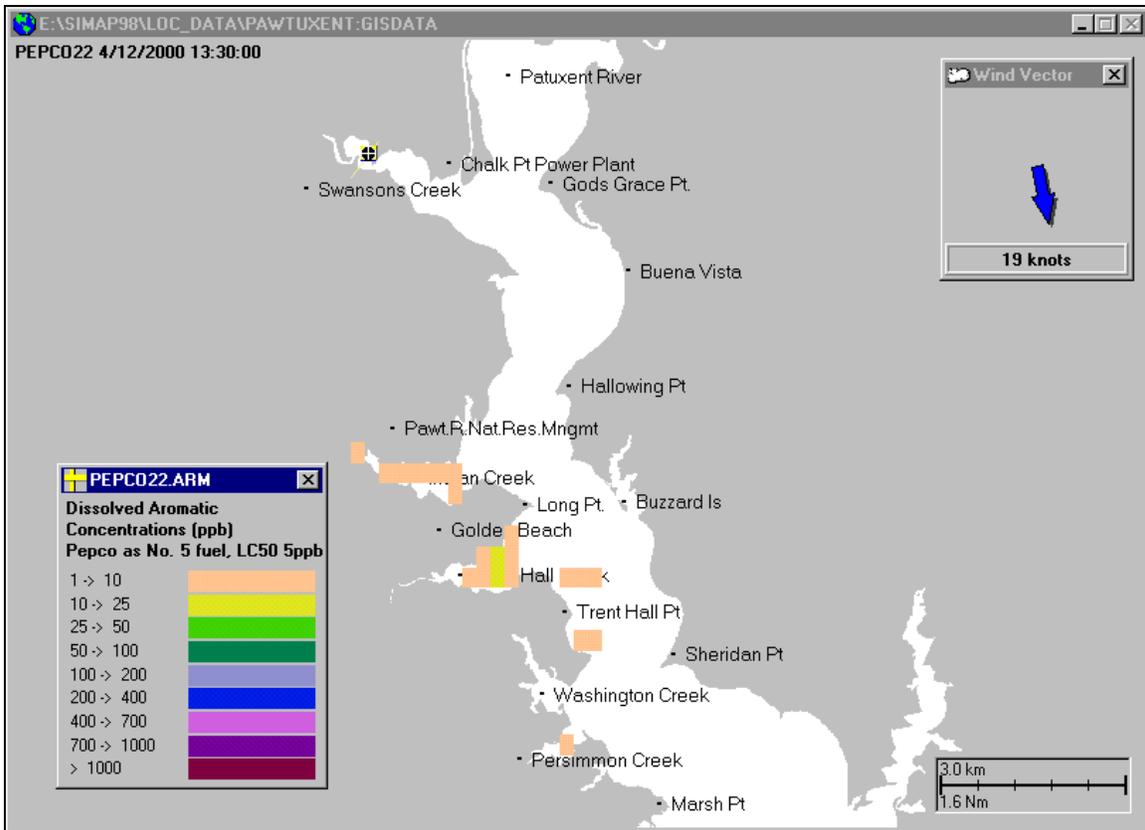

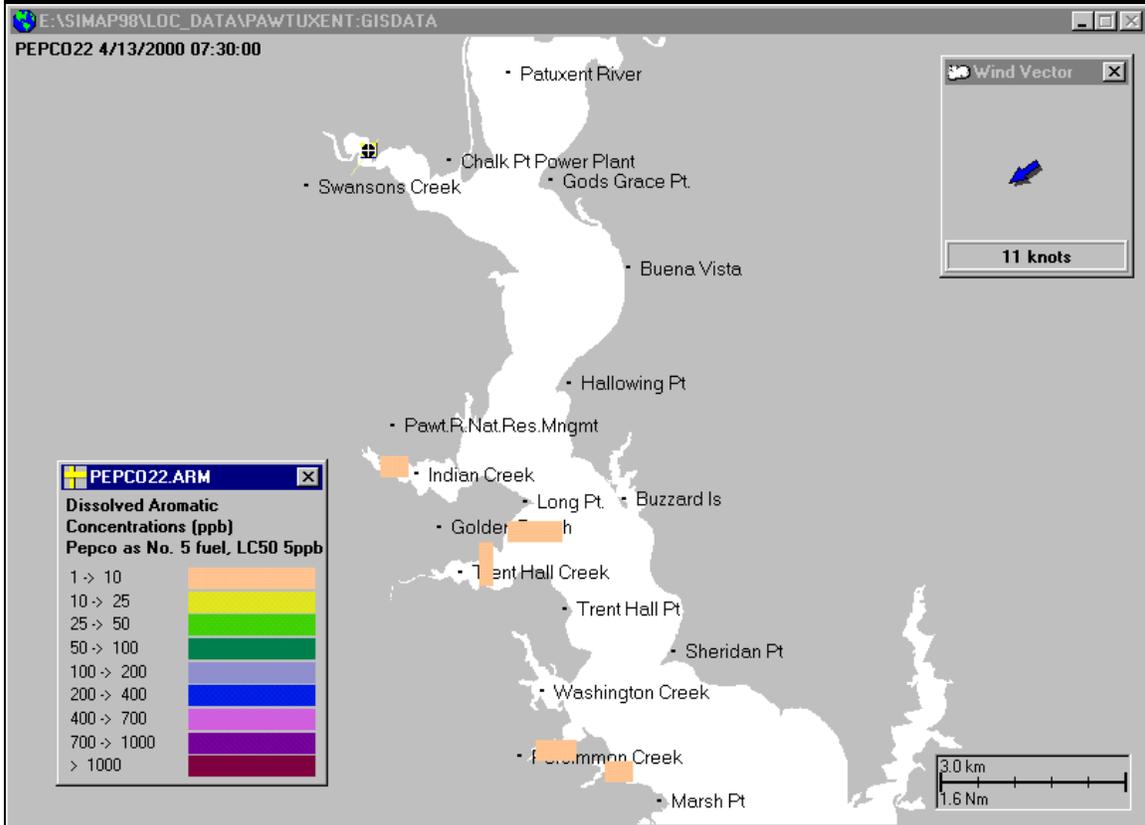

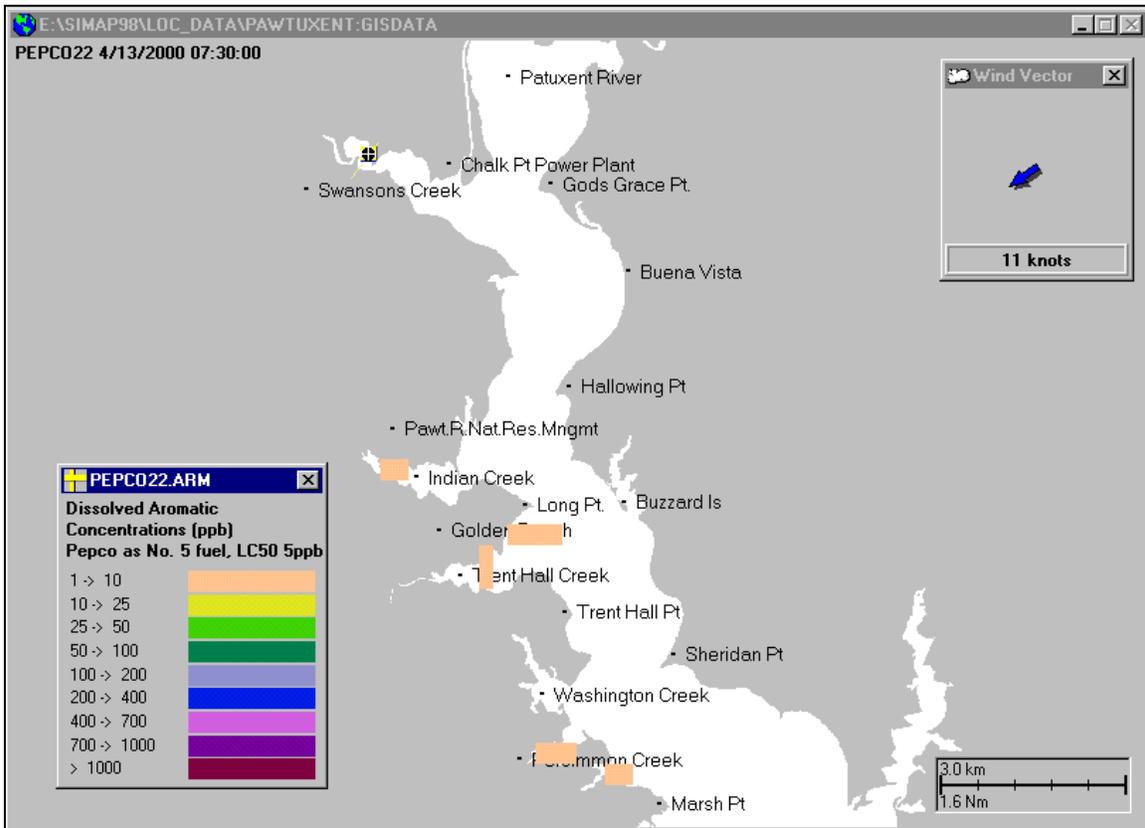

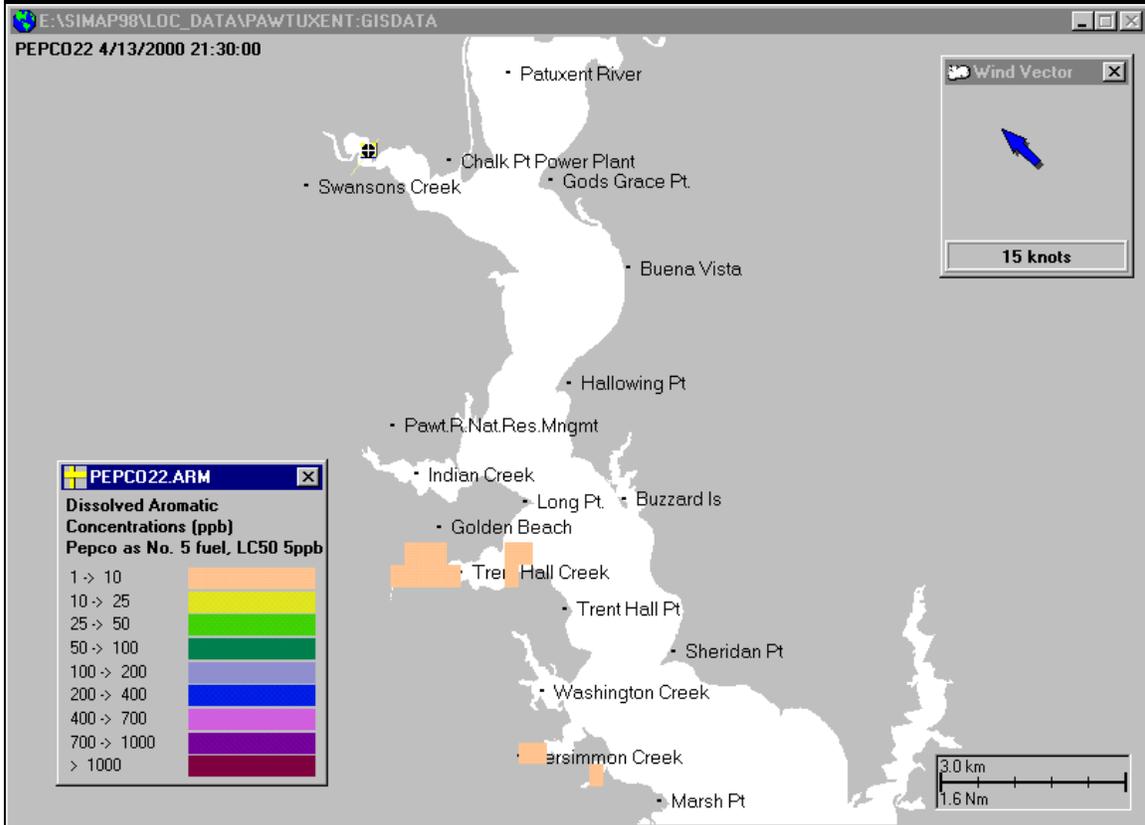

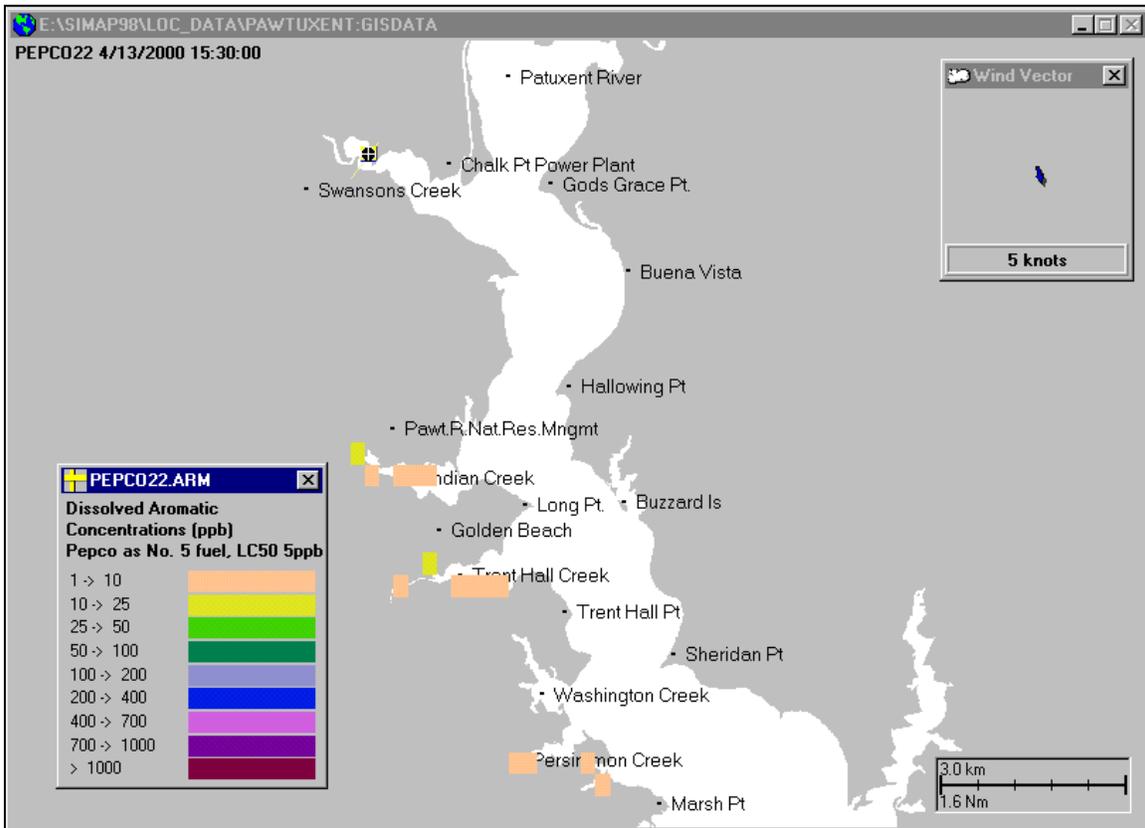

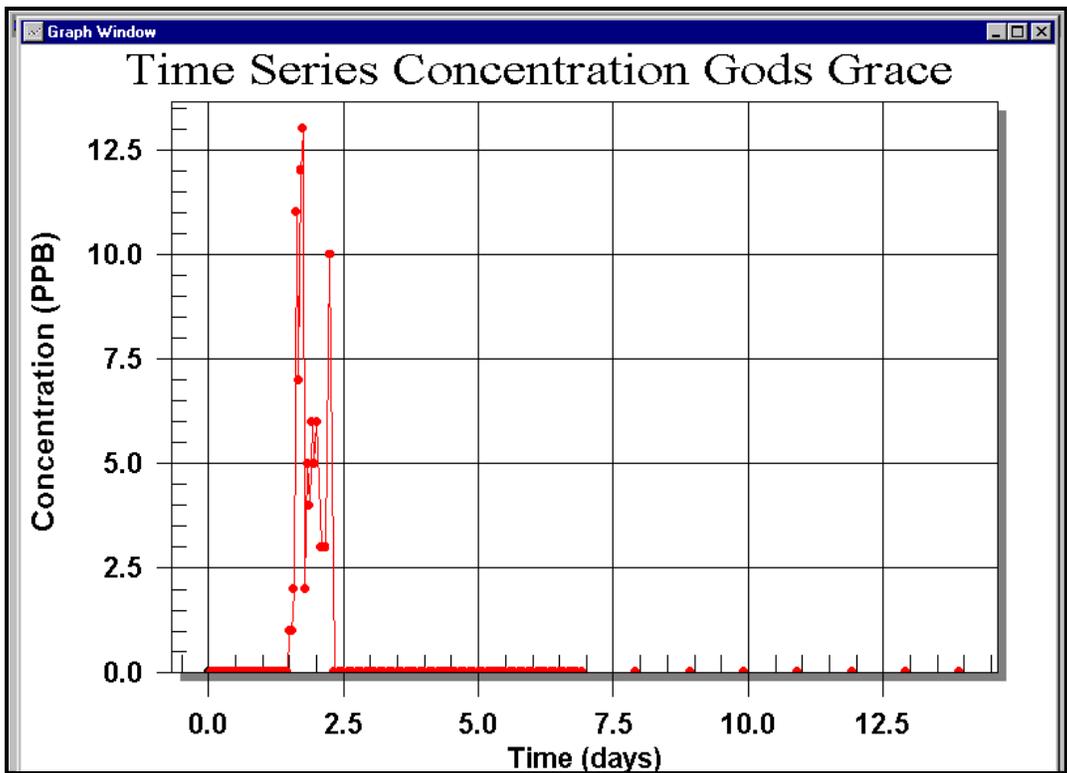

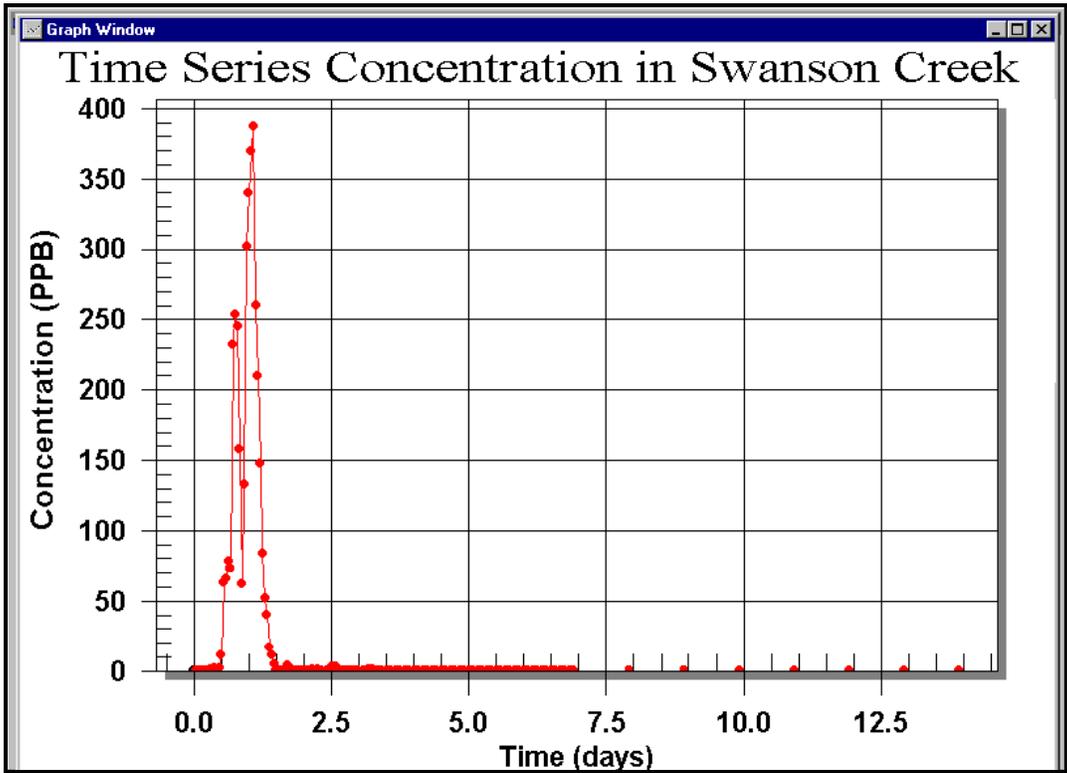

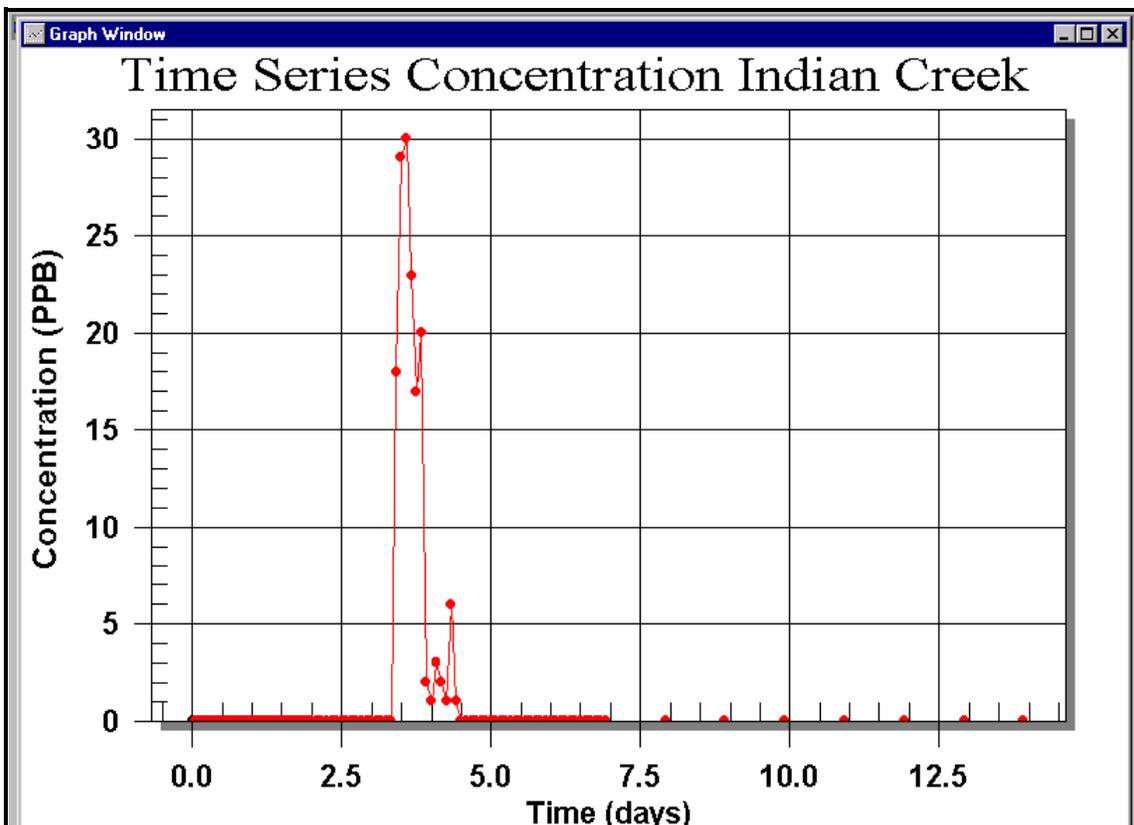

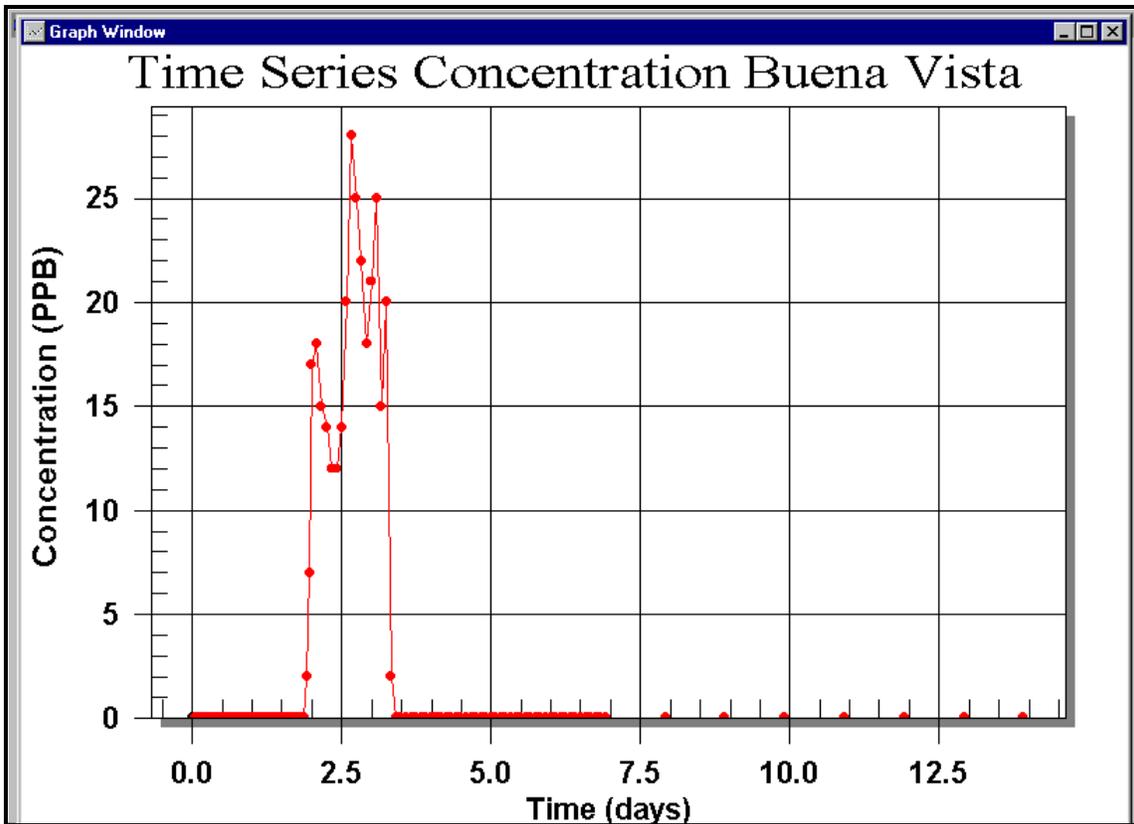

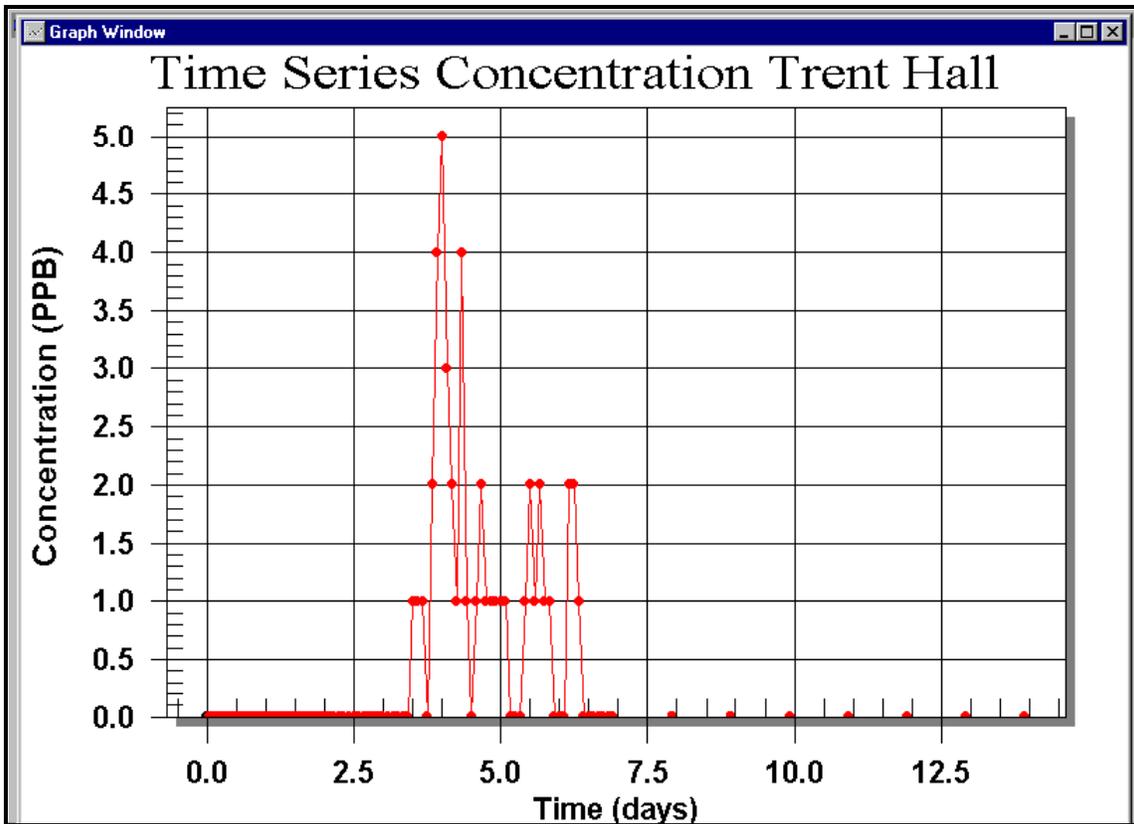

Appendix J. Modeled PAH Concentrations over Time

The following figures show plots of PAH concentrations (maximum vertically in the water column) as a function of time after the spill, for selected locations (as labeled).

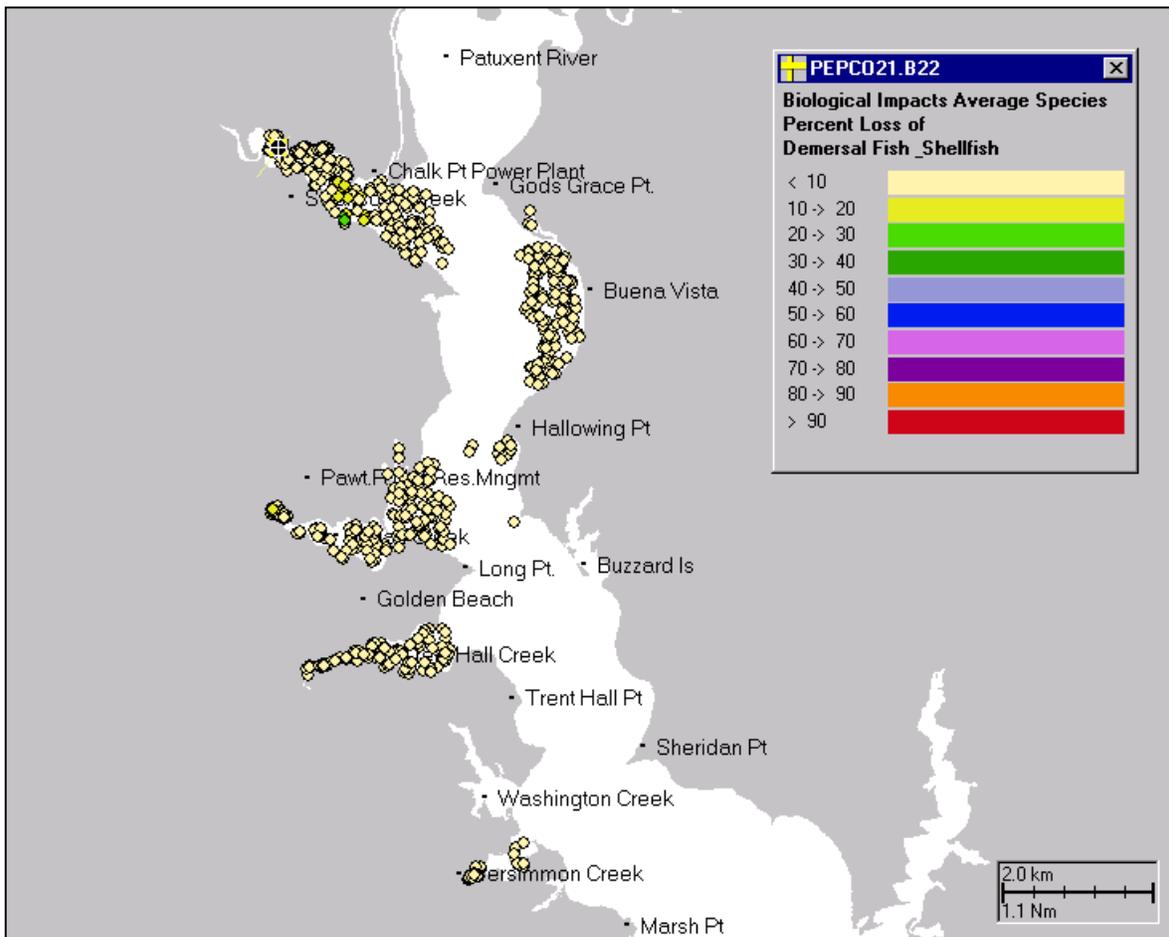

Appendix K. Modeled Percent Mortality

The following figures show maps of percent mortality for demersal fish and shellfish (exposed to near bottom water concentrations). Plots are included for two assumed LC50s: 75 µg/L for average species and 5 µg/L for sensitive species. (There are two plots for the sensitive species, one is a zoomed-in view with the <10% points removed for clarity.)

Note that the shoreline shown in these model outputs are for visual reference only, whereas the habitat (and corresponding depth) grid (Appendices B and C) defines the actual shoreline to the model.

Percent Loss for Species of Average Sensitivity (50th Percentile LC50 assumed)

Percent Loss for Sensitive Species (2.5th Percentile LC50 assumed)
